CSC343 Worksheet 6 Solution

June 21, 2020

1. **Exercise 6.6.1:**

a)

```
SET TRANSACTION READONLY;
BEGIN TRANSACTION;
    SELECT model, price FROM PC
    WHERE speed = speed AND
    ram=ram
COMMIT;

```

Notes:

- Transactions
  - is a collection of one or more operations that must be executed atomically
  - COMMIT causes the transaction to end successfully
  - ROLLBACK causes the transaction to abort. Any changes are undone
  - SET TRANSACTION READ ONLY
    - tells the database that it will not be modified
    - Must be declared before transaction

Example:

```
BEGIN TRANSACTION;

UPDATE accounts
SET balance = balance - 1000
WHERE account_no = 100;

UPDATE accounts
    SET balance = balance + 1000
WHERE account_no = 200;

INSERT INTO account_changes(account_no,flag,amount,
changed_at)
VALUES(100,'-',1000,datetime('now'));

```

```
    COMMIT;

    // Example - SET TRANSACTION READONLY
    SET TRANSACTION READONLY;
    BEGIN TRANSACTION;
        ...
    COMMIT;

```

2. **Exercise 8.1.1:**

a)
```
    CREATE VIEW RichExec AS
        SELECT * FROM MovieExec
        WHERE netWorth >= 10000000;

```

Notes:

- Virtual Views
  - **Syntax:** CREATE VIEW < view-name > AS < view-definition >
  - Contrasts to database that exists in physical storage
  - Exists in RAM
  - Is created using query
  - can be used like a relation

Notes:

```
        CREATE VIEW ParamountMovies AS
            SELECT title, year
            FROM Movies
            WHERE studioName = 'Paramount';

```

b)
```
    CREATE VIEW StudioPres AS
        SELECT * FROM Movies
        INNER JOIN Studio ON cert# = presC#;

```

c)
```
    CREATE VIEW ExecutiveStar AS
        SELECT * FROM MovieExec
        NATURAL JOIN MovieStar;

```

3. **Exericse 8.1.2:**

a)
```
    SELECT name, gender FROM ExecutiveStar;

```

b)
```
SELECT name FROM RichExec WHERE netWorth > 10000000;

```

c)
```
SELECT name FROM StudioPres
NATURAL JOIN ExecutiveStar
WHERE netWorth > 50000000

```

4. **Exericse 8.2.1:**

RichExec is updatable.

Notes:

- Updatable View Conditions
  - The WHERE cluase in CREATE VIEW must not be a subquery
  - The FROM clause has only one occurence of R
  - The SELECT clause must include enough attributes
  - NOT NULL attributes must have default values
    - A solution to this is by including the attribute without default value in CREATE VIEW

Example:

```
Movies(title, year, length, genre, studioName, producerC#)
Suppose studioName is NOT NULL but has no default value.
Then, a fix is:

CREATE VIEW Paramount AS
    SELECT studioName, title, year
    FROM Movies
    WHERE studioName = 'Paramount';

```

5. **Exericse 8.2.2:**

a) No. It is not updatable. Since,

1. studioName attribute in Movies is NOT NULL without default value

b)
```
CREATE TRIGGER DisneyComediesInsert
INSTEAD OF INSERT ON DisneyComedies
REFERENCING
    NEW ROW AS NewTuple
FOR EACH ROW
INSERT INTO Movies(title, year, length, genre, studioName)
VALUES(NewTuple.title, NewTuple.year, NewTuple.length, 'comedy',
'Disney');

```

Notes:

- Using Trigger in VIEW
  - Uses INSTEAD OF in place of BEFORE or AFTER
  - When event causes the trigger, the trigger is done instead of the event

Example:

```
    CREATE VIEW ParamountMovies AS
        SELECT title, year
        FROM Movies
        WHERE studioName = 'paramount';

    CREATE TRIGGER ParamountInsert
    INSTEAD OF INSERT ON ParamountMovies
    REFERENCING NEW ROW AS NewRow
    FOR EACH ROW
    INSERT INTO Movies(title, year, studioName)
    VALUES(NewRow.title, NewRow.year, 'Paramount');

```

c)

```
    CREATE TRIGGER DisneyComediesInsert
    INSTEAD OF INSERT ON DisneyComedies
    REFERENCING
        NEW ROW AS NewTuple
        OLD ROW AS OldTuple
    FOR EACH ROW
    UPDATE Movies
    SET length=NewTuple.length
    WHERE title=OldTuple.title AND year=OldTuple.year;

```

6. **Exercise 8.2.3**

a) No. the view is not updatable. Because for it to be updatable, only one relation must exist in FROM

b)

```
    CREATE TRIGGER NewPCInsert
    INSTEAD OF INSERT ON NewPC
    REFERENCING
        NEW ROW AS NewTuple
        OLD ROW AS OldTuple
    FOR EACH ROW
    INSERT INTO PC(model speed, ram, hd ,price)
    VALUES (NewTuple.model, NewTuple.speed, NewTuple.ram, NewTuple.hd
   , NewTuple.price);

    INSERT INTO Product(maker, model, type)
    VALUES (NewTuple.maker, NewTuple.model, 'pc');

```

c)

```
CREATE TRIGGER NewPCUpdate
INSTEAD OF INSERT ON NewPC
REFERENCING
    NEW ROW AS NewTuple
FOR EACH ROW
UPDATE PC
SET model=NewTuple.model
    speed=NewTuple.speed,
    ram=NewTuple.ram,
    hd=NewTuple.hd,
    price=NewTuple.price;

UPDATE Product
SET maker=NewTuple.maker,
    model=NewTuple.model,
    type='pc';

```

Correct Solution:

```
CREATE TRIGGER NewPCUpdate
INSTEAD OF UPDATE ON NewPC
REFERENCING
    NEW ROW AS NewTuple
FOR EACH ROW
UPDATE PC
SET model=NewTuple.model
    speed=NewTuple.speed,
    ram=NewTuple.ram,
    hd=NewTuple.hd,
    price=NewTuple.price;

UPDATE Product
SET maker=NewTuple.maker,
    model=NewTuple.model,
    type='pc';

```

d)

```
CREATE TRIGGER NewPCDelete
INSTEAD OF DELETE ON NewPC
REFERENCING
    NEW ROW AS NewTuple
FOR EACH ROW
DELETE FROM PC
WHERE model=NewTuple.model;

DELETE FROM Product
WHERE model=NewTuple.model;

```

7. a)
```
CREATE INDEX studioNameIndex Studio(name)
```

Notes:

- Indexes
  - **Syntax (Create Index):**
    CREATE INDEX < index-name > R(< attributes >)
  - **Syntax (Drop Index):**
    DROP INDEX < index-name >
  - Used to find tuples in a very large database
    - Is efficient
  - Can be thought as (key, value) pair in a binary search tree
  - e.g. Declaring Index
```
CREATE INDEX KeyIndex ON Movies(title, year);
```
  - e.g. Dropping index
```
CREATE INDEX KeyIndex ON Movies(title, year);
```

b)
```
CREATE INDEX movieExecAddressIndex MovieExec(address)
```

c)
```
CREATE INDEX movieKeyIndex Movies(genre, length)
```

8. **Exercise 8.4.1:**

Action	No Index	Star Index	Movie Index	Both Indexes
Q_1	100	4	100	4
Q_2	100	100	4	4
I	2	4	4	6
Average	$2 + 100p_1 + 100p_2$	$4 + 96p_2$	$4 + 96p_1$	$6 - 2p_1 - 2p_2$

Notes:

- Database Tuning
  - Index sppeds up queries that can use it
  - Index should NOT be created when modifications are the frequent choice of action

9. **Exercise 8.4.2:**

Omitted for the time being

10. **Exercise 8.5.1:**

```
1    UPDATE MovieProd
2    SET name='New Name'
3    WHERE (title, year) IN
4    (
5        SELECT title, year FROM Movies
6        INNER JOIN MovieExecs
7        ON Movies.productC# = MovieExec.cert#
8        WHERE cert# = '4567'
9    );
10
```

Notes:

- Materialized Views
  - Is also known as a summary
  - Is also known as black-box abstraction
  - Stores view in physical storage
  - Useful when storing expensive operation like AVG or COUNT
