Question 1

- Let $n \in \mathbb{N}$ and assume that $\exists k \in \mathbb{N}^+$, $n = 3^k$, so $k = \log_3 n$.

Then, since $n = 3^k$ and $3 \mid n$, we have $\lceil n/3 \rceil = n/3$.

Then,

$$T(n) = 2n + T(n/3) \quad [\text{By def.}] \quad (1)$$

$$= 2(n/3) + (2(n/3) + T(n/3^2)) \quad [\text{By substituting } n/3 \text{ for } n \text{ in def.}] \quad (2)$$

$$= 2^2(n/3) + T(n/3^2) \quad (3)$$

$$= 2^3(n/3^2) + T(n/3^3) \quad [\text{By substituting } n/3 \text{ for } n \text{ in def.}] \quad (4)$$

$$\vdots \quad (5)$$

$$= 2^k(n/3^{k-1}) + T(n/3^k) \quad [\text{After } k \text{ applications}] \quad (6)$$

$$= 2^{\log_3 n}(n/3^{\log_3 n - 1}) + T(n/3^{\log_3 n}) \quad [\text{By replacing } k = \log_3 n] \quad (7)$$

$$= 2^{\log_3 n}(n(3)/n) + T(n/n) \quad (8)$$

$$= 3 \cdot 2^{\log_3 n} + T(1) \quad (9)$$

$$= 3 \cdot 2^{\log_3 n} + 2 \quad (10)$$

Correct Solution:

Let $n \in \mathbb{N}$ and assume that $\exists k \in \mathbb{N}^+$, $n = 3^k$, so $k = \log_3 n$.

Then, since $n = 3^k$ and $3 \mid n$, we have $\lceil n/3 \rceil = n/3$.

Then,

$$T(n) = 2n + T(n/3) \quad [\text{By def.}] \quad (11)$$

$$= 2n + 2(n/3) + T(n/3^2) \quad [\text{By substituting } n/3 \text{ for } n \text{ in def.}] \quad (12)$$

$$= 2n + 2(n/3) + 2(n/3^2) + T(n/3^3) \quad [\text{By substituting } n/3 \text{ for } n \text{ in def.}] \quad (13)$$

$$\vdots \quad (14)$$

$$= 2 \sum_{i=0}^{k-1} n/3^i + T(n/3^k) \quad (15)$$

$$= 2 \cdot 3^k \left(\frac{1 - (1/3)^k}{1 - 1/3} \right) + T(n/3^k) \quad [\text{By using geometric series}] \quad (16)$$

$$= 2 \cdot 3^k \cdot 3/2 \left(1 - (1/3)^k \right) + T(n/n) \quad (17)$$

$$= 3(3^k - 1) + T(1) \quad (18)$$

$$= 3^{k+1} - 1 \quad (19)$$

Notes:

• Repeated Substitution:

- Is a technique used to find a closed form formula
- **closed form formula** is a simple formula that allows evaluation of $T(n)$ without the need to evaluate, say $T(n/2)$

i.e. from

$$T(n) = \begin{cases} c & \text{if } n = 1 \\ 2T(n/2) + dn & \text{if } n > 1 \end{cases} \quad (20)$$

to

$$T(n) = cn + dn \log_2 n$$

Example:

Consider the recurrence

$$T(n) = \begin{cases} c & \text{if } n = 1 \\ 2T(n/2) + dn & \text{if } n > 1 \end{cases} \quad (1)$$

Find closed form formula for $T(n)$, where n is an arbitrary power of 2. That is

$\exists k \in \mathbb{N}, n = 2^k$.

Let $n \in \mathbb{N}$ and assume that $\exists k \in \mathbb{N}^+, n = 2^k$, so $k = \log_2 n$.

Then,

$$T(n) = 2T(n/2) + dn \quad [\text{By 1}] \quad (2)$$

$$= 2\left(2T(n/2^2) + dn/2\right) + dn \quad [\text{By substituting } n/2 \text{ for } n \text{ in 1}] \quad (3)$$

$$= 2^2T(n/2^2) + 2dn \quad (4)$$

$$= 2^2\left(2T(n/2^3) + dn/2^2\right) + 2dn \quad [\text{By substituting } n/2^2 \text{ for } n \text{ in 1}] \quad (5)$$

$$= 2^3T(n/2^3) + 3dn \quad [\text{By substituting } n/2^2 \text{ for } n \text{ in 1}] \quad (6)$$

$$\vdots \quad (7)$$

$$= 2^kT(n/2^k) + kdn \quad [\text{After } k \text{ applications}] \quad (8)$$

$$= 2^{\log_2 n}T(n/2^{\log_2 n}) + (\log_2 n)dn \quad [\text{By replacing } k = \log_2 n] \quad (9)$$

$$= nT(1) + (\log_2 n)dn \quad (10)$$

$$= cn + (\log_2 n)dn \quad (11)$$

Question 2

- Let $n \in \mathbb{N}$. Assume $\exists k \in \mathbb{N}^+, n = 3^k$, so $\log_3 n = k$.

Then, because we know $3 \mid 3^k$, we can write $\lceil n/3 \rceil = n/3$.

Then,

$$R(n) = n + 3R(n/3) \quad [\text{By def.}] \quad (12)$$

$$= n + (n/3 + 3R(n/3^2)) \quad [\text{By substituting } n/3 \text{ for } n \text{ in def.}] \quad (13)$$

$$= n + n/3 + (n/3^2 + 3R(n/3^3)) \quad [\text{By substituting } n/3 \text{ for } n \text{ in def.}] \quad (14)$$

$$\vdots \quad (15)$$

$$= \sum_{i=0}^{k-1} n/3^i + 3R(n/3^k) \quad [\text{After k repeatitons}] \quad (16)$$

$$= n \left(\frac{1 - 1/3^k}{1 - 1/3} \right) + 3R(n/3^k) \quad (17)$$

$$= (3n)/2 \left(1 - 1/3^k \right) + 3R(n/3^k) \quad [\text{By using geometric series}] \quad (18)$$

$$= (3 \cdot 3^k)/2(1 - 1/3^k) + 3R(3^k/3^k) \quad [\text{By substituting } 3^k \text{ for } n] \quad (19)$$

$$= 3/2(3^k - 1) + 3R(1) \quad (20)$$

$$= 3/2(3^k - 1) + 3 \cdot 0 \quad [\text{By def.}] \quad (21)$$

$$= 3/2(3^k - 1) \quad (22)$$
