## Question 1

a.  $g \in \mathcal{O}(1) : \exists c, n_0 \in \mathbb{R}^+, \forall n \in \mathbb{N}, n \geq n_0 \Rightarrow g(n) \leq c$ , where  $g : \mathbb{N} \rightarrow \mathbb{R}^{\geq 0}$

**Notes:**

- $g \in \mathcal{O}(f) : \exists c, n_0 \in \mathbb{R}^+, \forall n \in \mathbb{N}, n \geq n_0 \Rightarrow g(n) \leq cf(n)$ , where  $f, g : \mathbb{N} \rightarrow \mathbb{R}^{\geq 0}$

b. **Predicate Logic**  $\exists c, n_0 \in \mathbb{R}^+, \forall n \in \mathbb{N}, n \geq n_0 \Rightarrow g(n) \leq c$ , where  $g : \mathbb{N} \rightarrow \mathbb{R}^{\geq 0}$

*Proof.* Let  $n_0 = 1$ ,  $c = 200$  and  $g(n) = 100 + \frac{77}{n+1}$ . Assume  $n \geq n_0$ .

We will prove the statement by showing

$$100 + \frac{77}{n+1} \leq c \tag{1}$$

It follows from the fact  $n_0 \geq 1$  that we can write

$$100 + \frac{77}{n+1} \leq 100 + \frac{77}{1+1} \quad (2)$$

$$\leq 100 + \frac{77}{2} \quad (3)$$

$$\leq 100 + 77 \quad (4)$$

$$\leq 100 + 100 \quad (5)$$

$$\leq 200 \quad (6)$$

Then,

$$100 + \frac{77}{n+1} \leq c \quad (7)$$

by the fact that  $c = 200$ . □

## Question 2

- **Predicate Logic:**  $\forall f, g : \mathbb{N} \rightarrow \mathbb{R}^{\geq 0}, (\exists c_0, n_0 \in \mathbb{R}^+, \forall n \in \mathbb{N}, n \geq n_0 \Rightarrow g(n) \leq c_0 f(n)) \Rightarrow (\exists d_0, m_0 \in \mathbb{R}^+, \forall n \in \mathbb{N}, n \geq m_0 \Rightarrow f(n) \geq d_0 g(n))$

*Proof.* Let  $f, g : \mathbb{N} \rightarrow \mathbb{R}^{\geq 0}$ . Let  $c = 2$ ,  $n_0 = 1$  and  $n \in \mathbb{N}$ . Assume  $n \geq n_0$ . Let  $d = \frac{1}{c}$  and  $m_0 = n_0$ . Assume  $n \geq m_0$ .

We will prove that  $d_0 g(n) \leq f(n)$  given  $g(n) \leq c_0 f(n)$ .

It follows from the assumption  $g(n) \leq f(n)$  that we can write

$$g(n) \leq c f(n) \quad (1)$$

$$\frac{1}{2} g(n) \leq f(n) \quad (2)$$

$$\frac{1}{2} g(n) \leq f(n) \quad (3)$$

Then since  $d = \frac{1}{2}$ ,

$$d \cdot g(n) \leq f(n) \quad (4)$$

□

### Question 3

- **Predicate Logic:**  $\forall g : \mathbb{N} \rightarrow \mathbb{R}^{\geq 0}, \forall a \in \mathbb{R}^{\geq 0}, (\exists c, n_0 \in \mathbb{R}^+, \forall n \in \mathbb{N}, n \geq n_0 \Rightarrow g(n) \geq c) \Rightarrow (\exists c_1, c_2, n_1 \in \mathbb{R}^+, \forall n \in \mathbb{N}, n \geq n_1 \Rightarrow c_1 g(n) \leq a + g(n) \leq c_2 g(n))$

*Proof.* Let  $g : \mathbb{N} \rightarrow \mathbb{R}^{\geq 0}$ , and  $a \in \mathbb{R}^{\geq 0}$ . Assume  $g \in \Omega(1)$ , that is there exists  $c, n_0 \in \mathbb{R}^+$ , for every  $n \in \mathbb{N}$  such that if  $n \geq n_0$ ,  $g(n) \geq c$ . Let  $c_1 = \frac{1}{2}$ ,  $c_2 = \left(\frac{a}{c} + 1\right)$  and  $n_1 = n_0$ . Assume  $n \geq n_1$ .

We will prove  $c_1 g(n) \leq a + g(n) \leq c_2 g(n)$  by diving into two parts, first by proving  $c_1 g(n) \leq a + g(n)$  is true, and then second by proving  $a + g(n) \leq c_2 g(n)$ . Then, we will combine the two at the end to finish.

**Part 1** ( $c_1 g(n) \leq a + g(n)$ ):

It follows from the fact  $a \in \mathbb{R}^+$  that we can write

$$a + g(n) \geq g(n) \quad (1)$$

$$\geq \frac{1}{2} \cdot g(n) \quad (2)$$

Then, because we know  $c_1 = \frac{1}{2}$ , we can conclude

$$a + g(n) \geq c_1 \cdot g(n) \quad (3)$$

**Part 2** ( $a + g(n) \leq c_2g(n)$ ):

Using the value  $c_2 = \left(\frac{a}{c} + 1\right)$ , we can write

$$c_2g(n) = \left(\frac{a}{c} + 1\right) \cdot g(n) \quad (4)$$

$$= \frac{a}{c} \cdot g(n) + g(n) \quad (5)$$

Then,

$$c_2g(n) \geq \frac{a}{c} \cdot c + g(n) \quad (6)$$

by the assumption that  $g(n) \geq c$ .

Then,

$$c_2g(n) \geq a + g(n) \quad (7)$$

Since both  $a + g(n) \leq c_2g(n)$  and  $c_1g(n) \leq a + g(n)$  are true, we can conclude that the inequality  $c_1g(n) \leq a + g(n) \leq c_2g(n)$  is true.

□

**Notes:**

- Noticed professor uses english phrase when expanding assumption.
- $g \in \Theta(f) : g \in \mathcal{O}(f) \wedge g \in \Omega(f)$   
or  
 $g \in \Theta(f) : \exists c_1, c_2, n_1 \in \mathbb{R}^+, \forall n \in \mathbb{N}, n \geq n_1 \Rightarrow c_1g(n) \leq f(n) \leq c_2g(n)$ , where  $f, g : \mathbb{N} \rightarrow \mathbb{R}^{\geq 0}$
- $g \in \Omega(f) : \exists c, n_o \in \mathbb{R}^+, \forall n \in \mathbb{N}, n \geq n_o \Rightarrow g(n) \geq cf(n)$ , where  $f, g : \mathbb{N} \rightarrow \mathbb{R}^{\geq 0}$
- $g \in \mathcal{O}(f) : \exists c, n_o \in \mathbb{R}^+, \forall n \in \mathbb{N}, n \geq n_o \Rightarrow g(n) \leq cf(n)$ , where  $f, g : \mathbb{N} \rightarrow \mathbb{R}^{\geq 0}$

## Question 4

- a.  $g \notin \mathcal{O}(f) : \exists g, f : \mathbb{N} \rightarrow \mathbb{R}^{\geq 0}, \forall c, n_0 \in \mathbb{R}^+, \exists n \in \mathbb{N}, (n \geq n_0) \wedge (g(n) > cf(n))$
- b. **Predicate Logic:**  $\forall a, b \in \mathbb{R}^+, a > b \Rightarrow n^a \notin \mathcal{O}(n^b)$

**Expanded Predicate Logic:**  $\forall a, b \in \mathbb{R}^+, a > b \Rightarrow \forall c, n_0 \in \mathbb{R}^+, \exists n \in \mathbb{N}, (n \geq n_0) \wedge (n^a > cn^b)$

*Proof.* Let  $a, \in \mathbb{R}^+$ . Assume  $a > b$ . Let  $c, n_0 \in \mathbb{R}^+$  and  $n = (n_0 + c)$ .

We will prove the statement  $(n \geq n_0) \wedge (n^a > cn^b)$  in two parts one for  $(n \geq n_0)$  and the other for  $(n^a > cn^b)$ . Then, we will combine the two parts to finish.

**Part 1**  $(n \geq n_0)$ :

Because we know  $n_0, c \in \mathbb{R}^+$ , we can conclude  $n_0, c > 0$ .

Using the fact  $n_0, c > 0$ , we can calculate

$$n_0 + c \geq n_0 \tag{1}$$

Then, because we know  $n_0 + c = n$ , we can conclude

$$n \geq n_0 \tag{2}$$

**Part 2**  $(n^a > cn^b)$ :

Since  $n = (n_0 + c)$ , we can calculate that

$$cn^b = c(n_0 + c)^b \quad (3)$$

Then,

$$cn^b < (c + n_0)(n_0 + c)^b \quad (4)$$

by the fact  $c, n_0 \in \mathbb{R}^+$  and  $c + n_0 > c$ .

Then,

$$cn^b < (c + n_0)^{a-b}(n_0 + c)^b \quad (5)$$

by the fact  $a > b$ .

Then,

$$cn^b < (c + n_0)^{a-b+b} \quad (6)$$

$$cn^b < (c + n_0)^a \quad (7)$$

Then, because we know  $c + n_0 = n$ , we can conclude

$$cn^b < n^a \quad (8)$$

Since part 1 and part 2 are both true, we can conclude  $(n \geq n_0) \wedge (n^a > cn^b)$  is true.

□

**Notes:**

- $\forall x, y \in \mathbb{R}^+, x > y \Leftrightarrow \log x > \log y$
