

# CSC369 Week 8 Notes

Hyungmo Gu

May 28, 2020

- File Systems

- Is the part of operating system dealing with files <sup>[2]</sup>
- Controls how data is stored and retrieved. <sup>[1]</sup>
  - \* Without a file system, data placed in a storage medium is one large body of data with no way to tell where it stops and the next begins

## Refernces:

- 1) Wikipedia: File Systems, link
- 2) Tanebaum AS, Boss H. 2015. Modern Operating Systems. 4th Edition. New Jersey: Pearson Education, Inc.

- File Concept

- Files

- \* Are logical units of information created by processes <sup>[1]</sup>
- \* Is named collection of data with some attributes
  1. Name
  2. Owner
  3. Location
  4. Size
  5. Protection
  6. Creation Time
  7. Time of Last Access

- Directories

- Are file system files for maintaining the structure of the file system <sup>[1]</sup>
- Serves multiple purposes
  - \* *All* → Stores information about files (owner, permission, etc)
  - \* *Users* → provides a structured way to organize files
  - \* *File System* → provides a convenient naming interface that allows the implementation to separate **logical file** organization from **physical file** placement on the disk
- **Logical files:** Is a channel that connects the program to the physical file (Stream) <sup>[2]</sup>
- **Physical files:** A collection of bits stored in the secondary storage <sup>[2]</sup>

### Example:

```
FILE* output;
output = fopen("sample.txt", "w");
```

Here, output is the logical file and sample.txt is the physical file

- Symbolic vs Hard Links

Andrew, Medium

– Inode

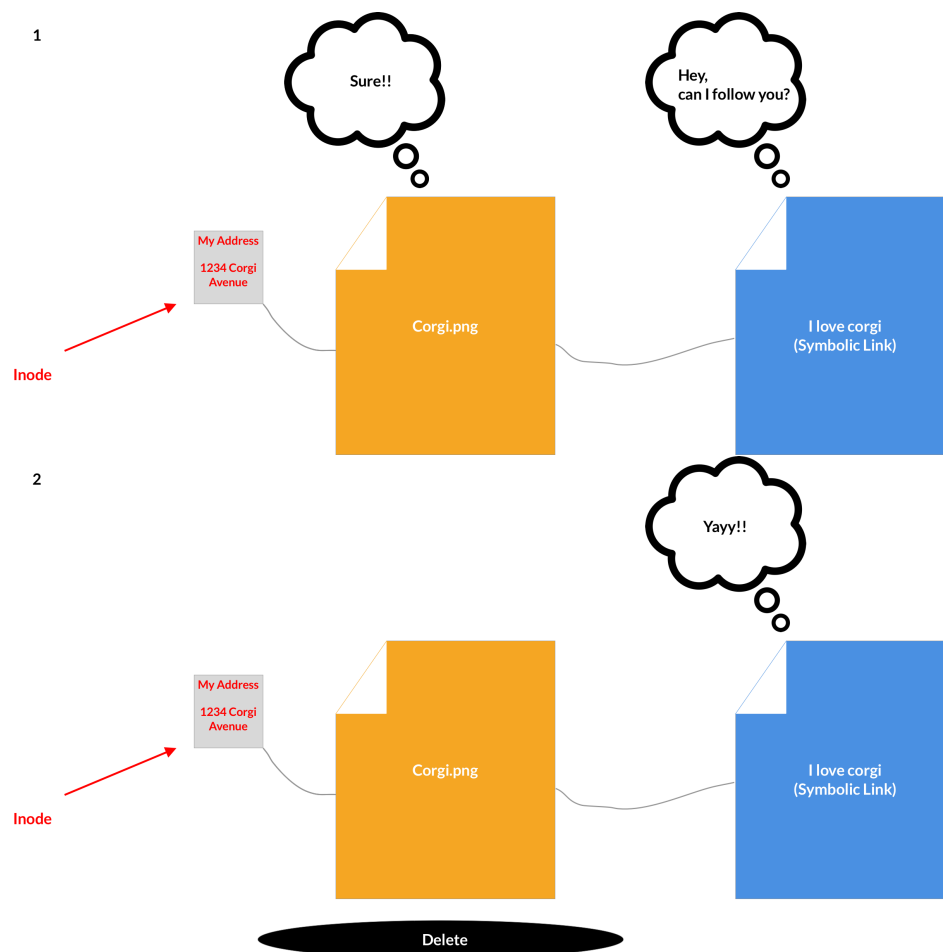

- \* Is a database structure in a UNIX-style file system that describes a file system object such as a file or a directory <sup>[1]</sup>
- \* Contains disk block location of the object's data <sup>[1]</sup>
- \* Is a numerical equivalent of a full address <sup>[2]</sup>

– **Symbolic Link:**

- \* Is directory entry containing "true" path to the file
- \* Is a shortcut that reference to a file instead of inode value <sup>[2]</sup>

– **Hard Link:**

- \* Is a direct reference to a file via its inode <sup>[2]</sup>
- \* Is second directory entry identical to first

3

- Protection

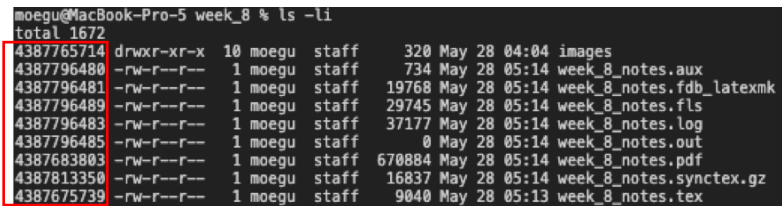

- File systems implement some kind of protection system
  - \* Who can access a file
  - \* How they can access it
- Protection system dictates whether given **action** by a given **subject** on a given **object** should be allowed
  - \* You can read and/or write your files, but others cannot
  - \* You can read "etc/motd", but you cannot write it

- Unix Inodes and Path Search

- Unix Inodes

- \* Is what we see on typing 'ls -li' command in terminal

```
moegu@MacBook-Pro-5 week_8 % ls -li
total 1672

```

inode number :)

- \* Describes where on the disk the blocks for a file are placed
- \* inode information is loaded to main memory <sup>[1]</sup>
  - Only for the corresponding files that are open
  - NOT all are loaded

### References:

- 1) Tanenbaum AS, Boss H. 2015. Modern Operating Systems. 4th Edition. New Jersey: Pearson Education, Inc.

#### • File Buffer Cache

- Reads information from disk only once and then stores retrieved file blocks in memory until no longer needed <sup>[1]</sup>
  - \* Because reading from disk is slow
  - \* Is common to read same part of disk multiple times

### Example:

1. Reading email message, read the message for an edit, and read the message again when copying to folder
