Question 1

a.

$$165 \div 2 = 82, \text{ remainders } \mathbf{1}$$

$$82 \div 2 = 41, \text{ remainders } \mathbf{0}$$

$$41 \div 2 = 20, \text{ remainders } \mathbf{1}$$

$$20 \div 2 = 10, \text{ remainders } \mathbf{0}$$

$$10 \div 2 = 5, \text{ remainders } \mathbf{0}$$

$$5 \div 2 = 2, \text{ remainders } \mathbf{1}$$

$$2 \div 2 = 1, \text{ remainders } \mathbf{0}$$

$$1 \div 2 = 0, \text{ remainders } \mathbf{1}$$

From the above, we can conclude the binary representation of the decimal number 165 is $(10100101)_2$

b. The largest number that can be expressed by an n -digit balanced ternary representation is

$$\sum_{i=0}^{n-1} 3^i = \frac{1}{2} \cdot (3^n - 1) \quad (1)$$

Notes:

- Geometric Series

$$\sum_{i=0}^n r^i = \frac{1 - r^{n+1}}{1 - r}, \text{ where } |r| > 1$$

c.

$f(n) \in \mathcal{O}(n)$	True	$g(n) \in \Omega(n)$	True	$f(n) \in \Omega(g(n))$	True
$f(n) \in \Theta(g(n))$	False	$g(n) \in \Theta(n)$	False	$f(n) + g(n) \in \Theta(g(n))$	False

Correct Solution:

$f(n) \in \mathcal{O}(n)$	True	$g(n) \in \Omega(n)$	True	$f(n) \in \Omega(g(n))$	True
$f(n) \in \Theta(g(n))$	False	$g(n) \in \Theta(n)$	False	$f(n) + g(n) \in \Theta(g(n))$	True

Notes:

- Note that for $f(n) + g(n) \in \Theta(g(n))$, large values of n causes $g(n) = n^{\log_2 n}$ to dominate $f(n) = \frac{3n}{\log_2 n + 8}$. This causes the inequality to be simplified to

$$c_1 \cdot n^{\log_2 n} \leq n^{\log_2 n} \leq c_2 \cdot n^{\log_2 n} \quad (1)$$

It follows from above the answer is True.

d.

k	0	1	2
$i * i$	$3 = 3^{2^0}$	$9 = 3^{2^1}$	$81 = 3^{2^4}$

From the rough work, we can deduce the value of i after k iterations is

$$3^{2^k} \quad (1)$$

- e. Loop termination occurs when $i_k \geq n^3$.

We need to find the smallest value of k , and the value is

$$\lceil \log_2 3 \log_3 n \rceil \quad (1)$$

Question 2

- **Statement:** $\forall n \in \mathbb{N}, n \geq 1 \Rightarrow \sum_{i=1}^n \frac{1}{\sqrt{i}} > \sqrt{n} - 1$

Let $n \in \mathbb{N}$.

We will prove the statement using induction on n .

Base Case ($n = 1$):

Let $n = 1$.

We want to show $\sum_{i=1}^1 \frac{1}{\sqrt{i}} > \sqrt{1} - 1$

Starting from the left hand side of the inequality, we can calculate

$$\sum_{i=1}^1 \frac{1}{\sqrt{i}} = \frac{1}{\sqrt{1}} \tag{1}$$

$$= 1 \tag{2}$$

$$> 0 \tag{3}$$

$$= \sqrt{1} - 1 \tag{4}$$

Question 3

Question 4
