

1. a) False
- b)

Notes

- **User Mode**

- Is restricted
- Executing code has no ability to *directly* access hardware or reference memory ^[1]
- Crashes are always recoverable ^[1]
- Is where most of the code on our computer / applications are executed ^[3]

- **Kernel Mode**

- Is privileged (non-restricted)
- Executing code has complete and unrestricted access to the underlying hardware ^[3]
- Is generally reserved for the lowest-level, most trusted functions of the operating system ^[1]
- Is fatal to crash; it will halt the entire PC (i.e the blue screen of death) ^[3]

- **Interrupt**

- Are signals sent to the CPU by external devices, normally I/O devices. ^[2]
- Tells the CPU to stop its current activities and execute the appropriate part of the operating system (**Interrupt Handler**). ^[2]
- Has three different types ^[2]

- 1) **Hardware Interrupts**

- * Are generated by hardware devices to signal that they need some attention from the OS.
- * May be due to receiving some data

Examples

- Keystrokes on the keyboard
- Receiving data on the ethernet card

- * May be due to completing a task which the operating system previously requested

Examples

Transferring data between the hard drive and memory

2) Software Interrupts

- * Are generated by programs when a system call is requested

3) Traps

- * Are generated by the CPU itself
- * Indicate that some error or condition occurred for which assistance from the operating system is needed
