

CSC343 Worksheet 14 Solution

July 11, 2020

1.

Correct Solution:

**Notes:**

- E/R Model
 - Means **Entity Relationship Model**
 - Entity Relationship Model(ER Modeling) is a graphical approach to database design.
 - Is comparable to class diagram in UML
 - Uses three principle element types:
 1. Entity sets
 - * Is an abstract object of some sort (i.e. entity)
 - * Is not used to represent class
 - * Is represented by rectangles

2. Attributes

- * Are properties of entities in a set (i.e. column name)
- * Each has its own primitive data types (e.g. String, integers, Reals)
- * Is represented by ovals

3. Relationships

- * Are connections among two or more entity sets (e.g. intermediary Relations like Stars In)
- * Is represented by diamond

Example:

- Multiway Relationships
 - Connects more than two relationship sets
 - Enables to represent relationships that otherwise is difficult in binary relationship
 - Arrow → 'one'
 - No arrow → 'many'

Example:

Example 2:

Figure 4.4: A three-way relationship

- Roles in Relationships
 - Is the label of edges between the entity set and relationship
 - Are used to clarify the semantics of relationship

Example:

Figure 4.5: A relationship with roles

Example 2:

Figure 4.6: A four-way relationship

- Attributes on Relationships

- can be thought as a property of tuples in the relationship set (i.e. String, Integer, Float, Boolean)

Example:

- Can be removed by creating an entity set with the attribute

Example:

- Converting Multiway Relationships to Binary

Example:

- Subclasses in the E/R Model
 - Has its own special attributes and/or relationships
 - All 'isa' relationship is one to one
 - Is represented by triangle with label 'isa' followed by entity set

4. a)

b)

c) They are the same. (I need more work on providing reason).

Notes:

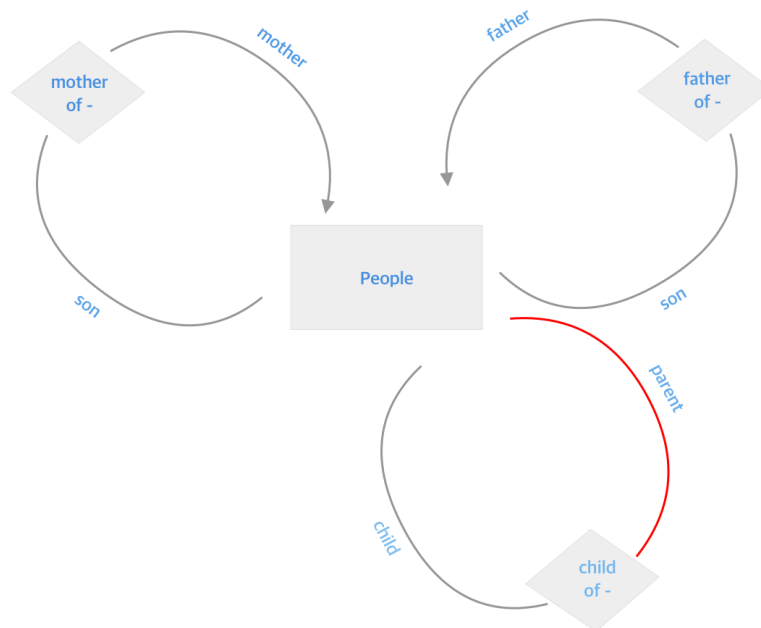

- I should ask professor about this :'(

5.

6.

Correct Solution:

7.

Notes:

- I feel the need to clarify with professor if two parent subclasses can exist
- I feel the need to ask professor whether this design is valid

8. a)

b)

Notes:

- I need to clarify with professor on one-to-many relationship.

Is it correct that the 'one' side of 'one-to-many' relationship represent foreign key in terms of SQL?

But how about the many side? What does it mean it to be many? so for example, ('Josh', 'Neville the father', 'Mary the mother'), ('Jay', 'Neville the father', 'Mary the mother'), is this one to many relationship?

In tabular terms / example what does one-to-many relationship represent in this context?

9.

10.

Correct Solution:

11. Simplicity count is violated. There is more than necessary number of entity sets and attributes for address and accounts.

Notes:

- Design Principles

1. Faithfulness

- means design should make sense and meet its specification
- e.g. Adding attribute *number-of-cylinders* to *Stars* → NONO

2. Avoiding Redundancy

- *Redundancy* means saying the same thing in two (or more) different ways

Example (The good example):

Example (The bad example):

3. Simplicity Counts

- Avoid adding more more elements than necessary

4. Choosing the Right Relationships

- Don't add relationships more than necessary

5. Picking the Right Kind of Element

- Many of the choices are between using attributes and using entity set / relationship combinations

12. They should be combined when each studio has unique president

i)

ii)

Notes:

- Keys in the E/R Model
 - *key* is an attribute or a group of attributes whose values can be used to uniquely identify an individual entity in an entity set ^[1]
 - Keys are represented using ‘underline’ under each attribute

- **Referential Integrity**

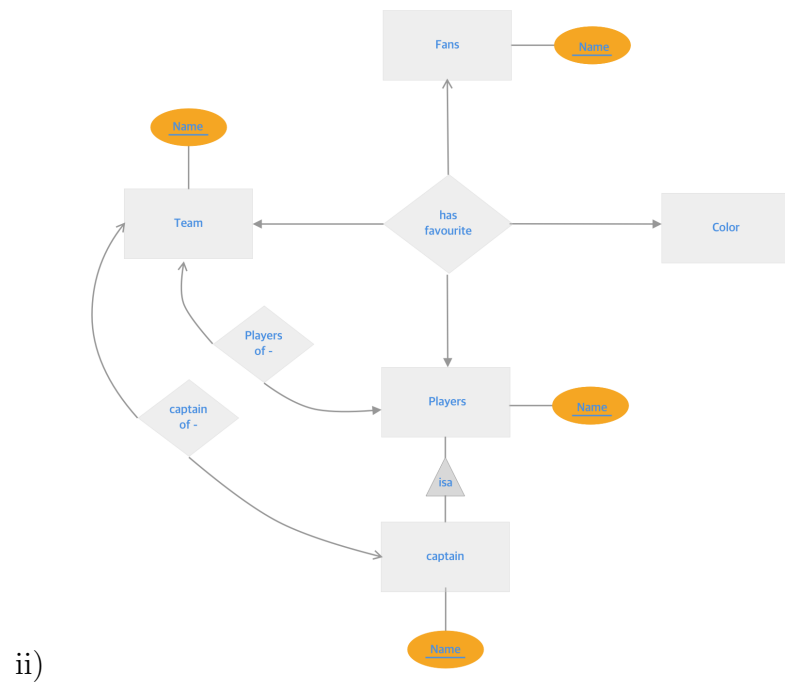

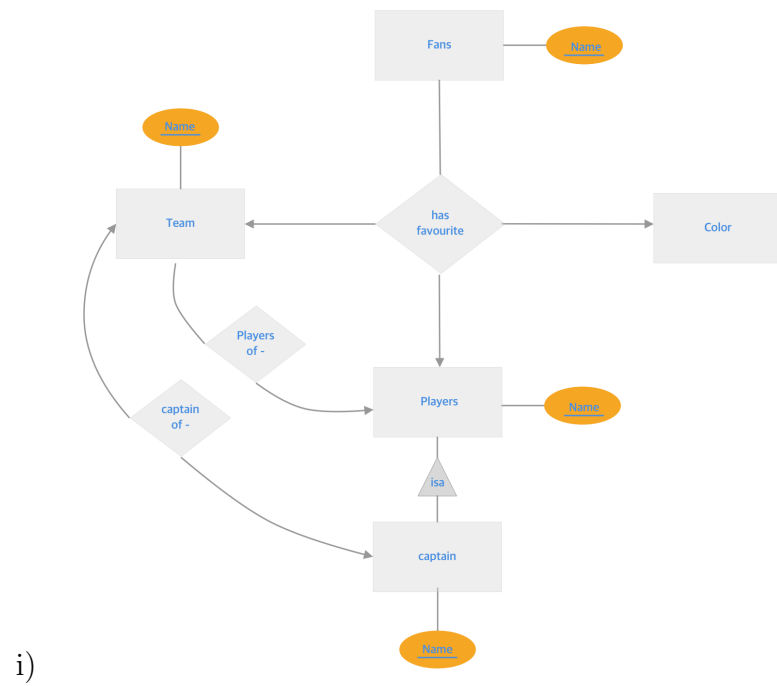

- Means value appearing in one context must also appear in another
- Functions like Foreign Key in SQL
- Is represented by a rounded arrow

16. **Solution:**

Correct Solution:

- Yes. grade is a part of a key for enrollent.

Notes:

- Weak Entity Sets
 - Is an entity set of which some or all of attributes belong to another entity set
 - The usual reason is that there is no global authority capable of creating unique ID's.
 - Is denoted by the following symbol:

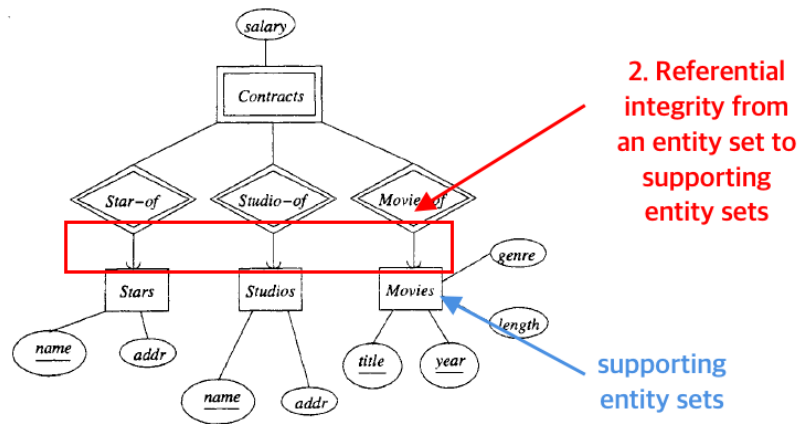

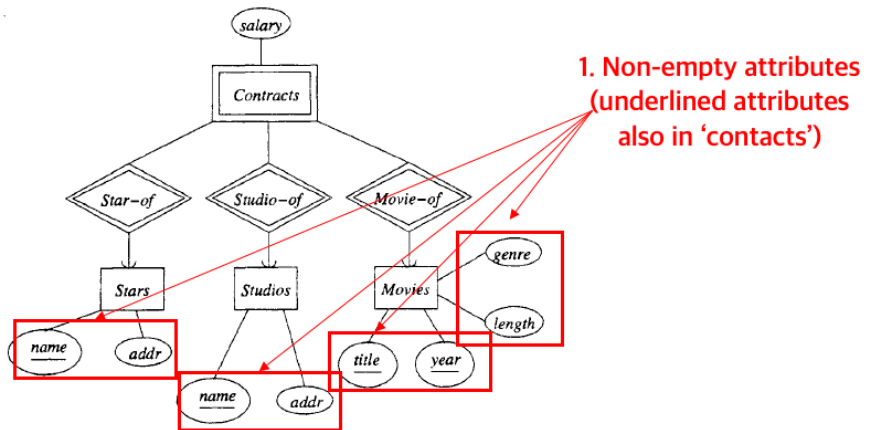

- Depends on a dominant entity, and it cannot exist without a strong entity. ^[1]
- Has attributes in both weak entity sets and the entity sets

Example:

- * Schemas for the strong entity sets
 - student (username)
 - assignment (shortname, due_date, url)
- * Schemas for the weak entity set
 - submission(username, shortname, version, submit_date, data)
- Requirements for Entity Sets
 - E is a weak entity if it consists of
 1. Zero or more of its own attributes, and
 2. One or more many-one relationships to other (supporting) entity sets. ^[2]

Correct Solution:

c)

Correct Solution:19. a) **Solution:**

b) **Solution:**

20. Notes:

- From entity sets to Relations
 - There are two basic steps
 1. Turn each entity set into a relation with the same set of attributes, and
 2. Replace a relationship by a relation whose attributes are the keys for the connected entity sets

Steps:

- a. Take key attributes in E and put to the relation of R
- b. Take attributes of R, and put into its relation
- c. **Notes:** Don't try to combine entity E with relationship R
 - * Doing so can lead to redundancy → requires normalization

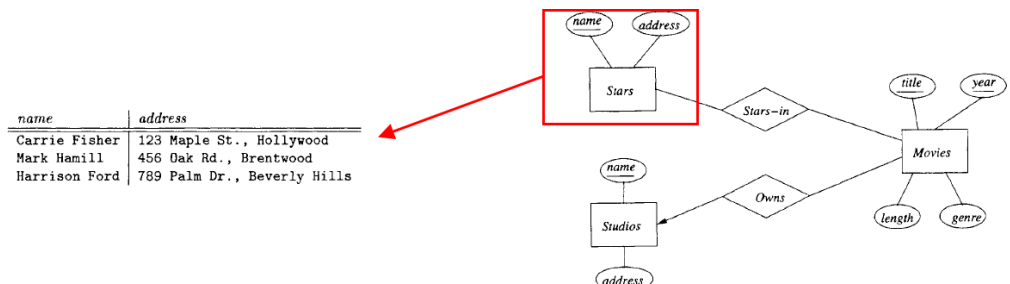

<i>title</i>	<i>year</i>	<i>length</i>	<i>genre</i>	<i>studioName</i>	<i>starName</i>
Star Wars	1977	124	SciFi	Fox	Carrie Fisher
Star Wars	1977	124	SciFi	Fox	Mark Hamill
Star Wars	1977	124	SciFi	Fox	Harrison Ford
Gone With the Wind	1939	231	drama	MGM	Vivien Leigh
Wayne's World	1992	95	comedy	Paramount	Dana Carvey
Wayne's World	1992	95	comedy	Paramount	Mike Meyers

Redundancies

- With more difficult steps
 1. Weak entity sets cannot be translated straightforwardly to relation
 2. 'Isa' relationship and subclasses require careful treatment
 3. Sometimes, we do well to combine two relations of different types (many-to-one → many-to-one) the connected entity sets

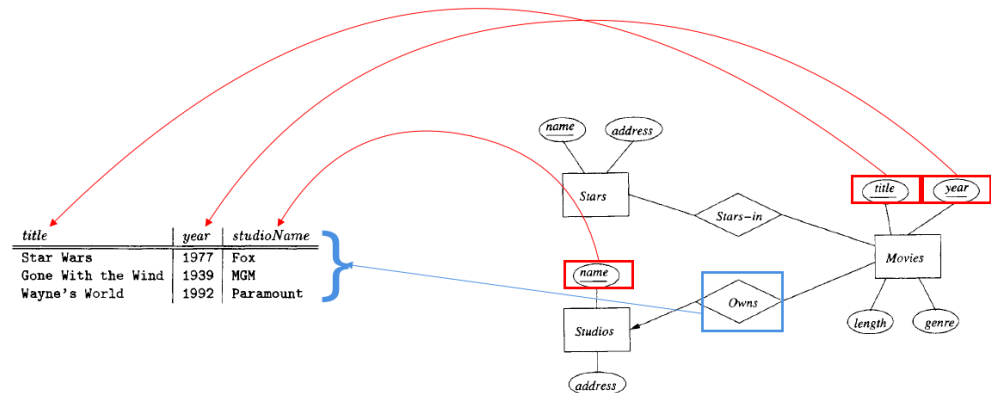

Example:

1. Turning each entity into relation

2. Turning E/R Relationships to Relations

* The schema of the relation 'Owns' is:

Owns(title, year, studioName)

• Handling weak entity sets

– Three things must be done differently

1. The relation for the weak entity set W must include the its own attributes, but also the attributes of the supporting entity sets
2. W should use key of it's attributes in addition to other entity sets that contribute to W's key
3. Do not convert the supporting sets to relation

Example:

Figure 4.28: The crews example of a weak entity set
