Question 1

- **Statement:** $\forall m, n \in \mathbb{Z}, (\exists k_1 \in \mathbb{Z}, m = 2k_1 + 1) \wedge (\exists k_2 \in \mathbb{Z}, n = 2k_2 + 1) \Rightarrow (\exists k_3 \in \mathbb{Z}, mn = 2k_3 + 1)$

Proof. Let $m, n \in \mathbb{Z}$. Assume there is an integer k_1 such that $m = 2k_1 + 1$. Assume there is an integer k_2 such that $n = 2k_2 + 1$. Let $k_3 = (2k_1k_2) + k_1 + k_2$.

We need to prove $mn = 2k_3 + 1$.

The assumption tells us $m = 2k_1 + 1$ and $n = 2k_2 + 1$.

By using these facts and then multiplying them together, we can conclude

$$mn = (2k_1 + 1)(2k_2 + 1) \tag{1}$$

$$= 4k_1k_2 + 2k_1 + 2k_2 + 1 \tag{2}$$

$$= 2[(2k_1k_2) + k_1 + k_2] + 1 \tag{3}$$

$$= 2k_3 + 1 \tag{4}$$
