# CSC373 Worksheet 3 Solution

July 29, 2020

## 1. Using the following formula

$$M[i,j] = \begin{cases} 0 & \text{if } i = j\\ \min_{i \le k \le j} M[i,k] + M[k+1,j] + p_{i-1}p_k p_j & \text{if } i < j \end{cases}$$
 (1)

we have

$\Box$	1	2	3	4	5	6
1	0	350	770	612	1212	1422
2	X	0	840	462	1662	1362
3	X	X	0	252	1092	1098
4	X	X	X	0	1440	936
5	X	X	X	X	0	720
6	X	X	X	X	x	0

And an optimal parenthesization is

#### My Work:

$$(A_1A_2)(A_3A_4)(A_5A_6)$$

## Notes:

• Sequence of Dimensions

The sequence of dimensions  $< p_0 = 5, p_1 = 10, p_2 = 3, p_2 = 12, p_3 = 5, p_4 = 50, p_5 = 6 >$  means there are 6 matrices with dimensions  $p_{i-1} \times p_i$ 

$$-A_1 \rightarrow 5 \times 10$$

- $-A_2 \rightarrow 10 \times 3$
- $-A_3 \rightarrow 3 \times 12$
- $-A_4 \rightarrow 12 \times 5$
- $-A_5 \rightarrow 5 \times 50$
- $-A_6 \rightarrow 50 \times 6$
- Dynamic Programming
  - Is applied to optimization problems
  - Applies when the subproblems overlap
  - Uses the following sequence of steps
    - 1. Characterize the structure of an optimal solution
    - 2. Recursively define the value of an optimal solution
    - 3. Construct an optimal solution from computed information
- Matrix-chain Multiplication
  - Is an optimization problem solved using dynamic programming
  - Goal is to find matrix parenthesis with fewest number of operations

## Example:

Given chain of matrices  $\langle A, B, C \rangle$ , it's fully parenthesized product is:

- \* (AB)C needs  $(10 \times 30 \times 5) + (10 \times 5 \times 60) = 1500 + 3000 = 4500$  operations
- \* A(BC) needs  $(30 \times 5 \times 60) + (10 \times 30 \times 60) = 27000$  operations

Thus, (AB)C performs more efficiently than A(BC).

- Is stated as: given a chain  $\langle A_1, A_2, ..., A_n \rangle$  of n matrices, where for i = 1, 2, ..., n matrix  $A_i$  has dimension  $p_{i-1} \times p_i$ , fully parenthesize the product  $A_1A_2...A_n$  in a way that minimizes the number of scalar multiplications.
- Steps

#### 1. Check is the problem has Optimal Substructure

Let us adopt the notation  $A_{i...j}$  where  $i \leq j$ , for the matrix that results from evaluating the product  $A_i A_{i+1} ... A_j$ .

Assume the solution has the following parentheses:

$$(A_{i...k})(A_{k+1...j})$$

If there is a better way to multiply  $(A_{i...k})$ , then we would have a more optimal solution.

This would be a contradiction, as we already stated that we have the optimal solution for  $A_{i...j}$ .

Therefore, this problem has optimal substructure.

#### 2. Find the Recursive Solution

Let M[i,j] be the cost of multiplying matrices from  $A_i$  to  $A_j$ 

We want to find out at which k' returns the fewest number of multiplications, or the minimum number of M.

The recursive formula for the cost of multiplying from  $A_i$  to  $A_j$  is

$$M[i,j] = \begin{cases} 0 & \text{if } i = j \\ \min_{i \le k \le j} M[i,k] + M[k+1,j] + p_{i-1}p_k p_j & \text{if } i < j \end{cases}$$
 (2)

## 3. Computing the Estimated Cost

- \* Steps
  - 1) Fill the table for i = j
  - 2) Fill the table for i < j with a spread of 1
  - 3) Repeat 2 with the increased value of spread

#### Example:

Given

$$< A_1, A_2, A_3, A_4, A_5 >$$

where

- \*  $A_1 \rightarrow 4 \times 10$
- \*  $A_2 \rightarrow 10 \times 3$
- \*  $A_3 \rightarrow 3 \times 12$
- \*  $A_4 \rightarrow 12 \times 20$
- \*  $A_5 \rightarrow 20 \times 7$

we have:

1) Fill the table for i = j

1) i = j

i\j	1	2	3	4	5
1	0				
2	x	0			
3	x	x	0		
4	x	×	x	0	
5	x	х	х	х	0

$$M[i,j] = \begin{cases} 0 & \text{if } i = j \\ \min_{i \le k \le j} M[i,k] + M[k+1,j] + p_{i-1}p_kp_j & \text{if } i < j \end{cases}$$

2) Fill the table for i < j with a spread of 1

2) 
$$(i = 1, j = 2)$$
,  $(i = 2, j = 3)$ ,  $(i = 3, j = 4)$ ,  $(i = 4, j = 5)$ 

i\j	1	2	3	4	5
1	0	120			
2	x	0	360		
3	x	х	0	720	
4	x	х	х	0	1680
5	x	х	х	x	0

since

$$* i = 1, j = 2$$

$$M[1,2] = \min_{1 \le k \le 2} (M[1,1] + M[1,2] + p_{i-1}p_k p_j)$$
(3)

$$= \min_{1 \le k \le 2} (0 + 0 + p_0 p_1 p_2) \tag{4}$$

$$= \min_{1 \le k \le 2} (0 + 0 + 4 \cdot 10 \cdot 3) \tag{5}$$

$$= 120 \tag{6}$$

where  $p_0 = 3$  is from the dimension  $3 \times 10$  of  $A_1$ ,  $p_k = 10$  is from the dimension of  $3 \times 10$  of  $A_1$ .

$$* i = 2, j = 3$$

$$M[2,3] = \min_{2 \le k \le 3} (M[2,2] + M[3,3] + p_{i-1}p_k p_j)$$
 (7)

$$= \min_{2 \le k \le 3} (0 + 0 + p_1 p_2 p_3) \tag{8}$$

$$= \min_{2 \le k \le 3} (0 + 0 + 10 \cdot 3 \cdot 12) \tag{9}$$

$$= 360 \tag{10}$$

\*i = 3, j = 4

$$M[3,4] = \min_{3 \le k \le 4} (M[3,3] + M[4,4] + p_{i-1}p_k p_j)$$
 (11)

$$= \min_{3 \le k \le 4} (0 + 0 + p_2 p_3 p_4) \tag{12}$$

$$= \min_{3 \le k \le 4} (0 + 0 + 3 \cdot 12 \cdot 20) \tag{13}$$

$$=720\tag{14}$$

\*i = 4, j = 5

$$M[4,5] = \min_{4 \le k \le 5} (M[4,4] + M[5,5] + p_{i-1}p_k p_j)$$
 (15)

$$= \min_{4 \le k \le 5} (0 + 0 + p_3 p_4 p_5) \tag{16}$$

$$= \min_{4 \le k \le 5} (0 + 0 + 12 \cdot 20 \cdot 7) \tag{17}$$

$$= 1680$$
 (18)

3) Repeat 2 with the increased value of spread

2) 
$$(i = 1, j = 2)$$
,  $(i = 2, j = 3)$ ,  $(i = 3, j = 4)$ ,  $(i = 4, j = 5)$ 

i\j	1	2	3	4	5
1	0	120	264	1080	1344
2	x	0	360	1320	1350
3	х	х	0	720	1140
4	х	x	х	0	1680
5	x	х	х	х	0

$$* i = 1, j = 3$$

$$\underline{k=1}$$

$$M[1,3] = M[1,1] + M[2,3] + p_{i-1}p_k p_j$$
(19)

$$= 0 + 360 + p_0 p_1 p_3 \tag{20}$$

$$= 0 + 360 + 4 \cdot 10 \cdot 12 \tag{21}$$

$$= 0 + 360 + 480 \tag{22}$$

$$= 840$$
 (23)

 $\underline{k=2}$ 

$$M[1,3] = M[1,2] + M[3,3] + p_{i-1}p_kp_j$$
(24)

$$= 120 + 0 + p_0 p_2 p_3 \tag{25}$$

$$= 120 + 0 + 4 \cdot 10 \cdot 12 \tag{26}$$

$$= 120 + 0 + 144 \tag{27}$$

$$= 264 \tag{28}$$

Thus,  $\min_{1 \le k \le 3} M[1, 3] = 264$ .

$$* i = 2, j = 4$$

k = 2

$$M[2,4] = M[2,2] + M[3,4] + p_{i-1}p_k p_j$$
(29)

$$= 0 + 720 + p_1 p_2 p_4 \tag{30}$$

$$= 0 + 720 + 10 \cdot 3 \cdot 20 \tag{31}$$

$$= 0 + 720 + 600 \tag{32}$$

$$= 1320$$
 (33)

k = 3

$$M[2,4] = M[2,2] + M[3,4] + p_{i-1}p_kp_j$$
(34)

$$= 360 + 0 + p_1 p_3 p_4 \tag{35}$$

$$= 360 + 0 + 10 \cdot 12 \cdot 20 \tag{36}$$

$$= 360 + 0 + 2400 \tag{37}$$

$$=2760$$
 (38)

Thus,  $\min_{2 \le k \le 4} M[2, 4] = 1320$ .

$$*i = 3, j = 5$$

k = 3

$$M[3,5] = M[3,3] + M[3,5] + p_{i-1}p_kp_j$$
(39)

$$= 0 + 1680 + p_2 p_3 p_5 \tag{40}$$

$$= 0 + 1680 + 3 \cdot 12 \cdot 7 \tag{41}$$

$$= 0 + 1680 + 252 \tag{42}$$

$$= 1932 \tag{43}$$

 $\underline{k=4}$ 

$$M[3,5] = M[3,4] + M[5,5] + p_{i-1}p_kp_j$$
(44)

$$= 720 + 0 + p_2 p_4 p_5 \tag{45}$$

$$= 720 + 0 + 3 \cdot 20 \cdot 7 \tag{46}$$

$$= 720 + 420 \tag{47}$$

$$= 1140 \tag{48}$$

Thus,  $\min_{3 \le k \le 5} M[3, 5] = 1140$ .

$$* i = 2, j = 5$$

 $\underline{k=2}$ 

$$M[2,5] = M[2,2] + M[3,5] + p_{i-1}p_kp_j$$
(49)

$$= 0 + 1140 + p_1 p_2 p_5 \tag{50}$$

$$= 0 + 1140 + 10 \cdot 3 \cdot 7 \tag{51}$$

$$= 0 + 1140 + 210 \tag{52}$$

$$= 1350 \tag{53}$$

 $\underline{k=3}$ 

$$M[2,5] = M[2,3] + M[4,5] + p_{i-1}p_kp_j$$
(54)

$$= 360 + 1680 + p_1 p_3 p_5 \tag{55}$$

$$= 2040 + 10 \cdot 12 \cdot 7 \tag{56}$$

$$= 2040 + 840 \tag{57}$$

$$=2880\tag{58}$$

 $\underline{k=4}$ 

$$M[2,5] = M[2,4] + M[5,5] + p_{i-1}p_kp_j$$
(59)

$$= 1320 + p_1 p_3 p_5 \tag{60}$$

$$= 1320 + 10 \cdot 20 \cdot 7 \tag{61}$$

$$= 1320 + 1400 \tag{62}$$

$$=2720$$
 (63)

Thus,  $\min_{2 \le k \le 5} M[2, 5] = 1350$ .

\* 
$$i = 1, j = 5$$

 $\underline{k} = 1$ 

$$M[1,5] = M[1,1] + M[3,5] + p_{i-1}p_kp_j$$
(64)

$$= 0 + 1350 + p_0 p_1 p_5 \tag{65}$$

$$= 0 + 1350 + 4 \cdot 10 \cdot 7 \tag{66}$$

$$= 0 + 1350 + 280 \tag{67}$$

$$= 1630 \tag{68}$$

 $\underline{k} = 2$ 

$$M[1,5] = M[1,2] + M[3,5] + p_{i-1}p_kp_i$$
(69)

$$= 120 + 1140 + p_0 p_2 p_5 \tag{70}$$

$$= 120 + 1140 + 4 \cdot 3 \cdot 7 \tag{71}$$

$$= 1260 + 84 \tag{72}$$

$$= 1344 \tag{73}$$

 $\underline{k=3}$ 

$$M[1,5] = M[1,3] + M[4,5] + p_{i-1}p_kp_j$$
(74)

$$= 264 + 1680 + p_0 p_3 p_5 \tag{75}$$

$$= 264 + 1680 + 4 \cdot 12 \cdot 7 \tag{76}$$

$$= 1944 + 336 \tag{77}$$

$$=2280\tag{78}$$

 $\underline{k=4}$ 

$$M[1,5] = M[1,4] + M[5,5] + p_{i-1}p_kp_i$$
(79)

$$= 1080 + 0 + p_0 p_4 p_5 \tag{80}$$

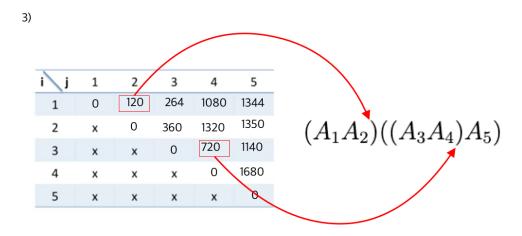

$$= 1080 + 4 \cdot 20 \cdot 7 \tag{81}$$

$$= 1080 + 560 \tag{82}$$

$$= 1640$$
 (83)

Thus,  $\min_{1 \le k \le 5} M[1, 5] = 1344$ .

## 4. Constructing the Optimal Solution

So, the optimal solution is  $(A_1A_2)((A_3A_4)A_5)$ 

#### References:

1)

```
2_1
       procedure MATRIX-CHAIN-MULTIPLY(A,s,i,j)
2
           if i == j then
                return A[i]
3
           end if
 5
           if i < j
6
                a = MATRIX-CHAIN-MULTIPLY(A,s,i,s[i,j])
                b = MATRIX - CHAIN - MULTIPLY(A,s,s[i,j] + 1,j)
9
                return MATRIX-CHAIN-MULTIPLY(a,b)
10
11
           end if
12
13
       end procedure
14
15
```

## Example:

- $\bullet$   $\mathit{MATRIX-CHAIN-ORDER}$  computes the table s containing optimal costs
- $\bullet$  s table consists of k value at which m[i,j] is minimum!!

$$A_{1..s[1,n]}A_{s[1,n]+1..n}$$

ullet Table of optimal costs m is used with m to construct solution to matrix-chain multiplication problem
