CSC343 Worksheet 7 Solution

June 23, 2020

```
1. a)
         void askUserForPrice() {
              EXEC SQL BEGIN DECLARE SECTION;
                  int model;
   3
                  float speed;
                  int ram;
                  int hd;
   6
                  float price;
                  char maker;
   8
                  float targetPrice;
                  float minDiff;
   11
                  int modelSol;
   12
                  float speedSol;
   13
                  char makerSol;
   14
             EXEC SQL END DECLARE SECTION;
   15
   16
              EXEC SQL DECLARE execCursor CURSOR FOR
   17
                  SELECT * FROM Product NATURAL JOIN PC
   18
   19
              EXEC SQL OPEN execCursor;
   20
   21
              printf("Enter target price:");
   22
              scanf("%f", &targetPrice);
   23
              while(1) {
   25
                  EXEC SQL FETCH FROM execCursor INTO :model,
   26
                       :speed, :ram, :hd, :price, :maker;
                  if (NO_MORE_TUPLES) break;
   29
                  if (abs(price - targetPrice) >= minDiff) {
   31
                       continue;
   32
   33
   34
                  minDiff = abs(price - targetPrice);
   35
                  modelSol = model;
   36
                  speedSol = speed;
   37
                  makerSol = maker;
   38
```

```
EXEC SQL CLOSE execCursor;

printf("maker=%c, model=%d, speed=%.2f\n", makerSol, modelSol, speedSol);

speedSol);

}
```

Notes:

- EXEC SQL
 - Allows to use SQL statements within a host-language program
- The DECLARE Section
 - is used to declare shared variables
 - Syntax:

```
EXEC SQL BEGIN DECLARE SECTION; ... // Variable declarations in any language EXEC SQL END DECLARE SECTION;
```

Example:

```
void getStudio() {
    EXEC SQL BEGIN DECLARE SECTION;
    char studioName[50], studioAddr[256]; // <- c
    variables

char SQLSTATE[6];
    EXEC SQL END DECLARE SECTION;

EXEC SQL INSERT INTO Studio(name, address)
    VALUES (:studioName, :studioAddr);
}
</pre>
```

- Cursors
 - Is the most versatile way to connect SQL queries
 - Syntax:

```
EXEC SQL DECLARE < cursor name > CURSOR FOR < query >
```

```
EXEC SQL OPEN < cursor name >; ...
```

 ${\rm EXEC~SQL~CLOSE} < {\rm cursor~name} >;$

Example:

```
void getStudio() {
    EXEC SQL BEGIN DECLARE SECTION;
    char studioName[50], studioAddr[256]; // <- c
    variables

char SQLSTATE[6];
    EXEC SQL END DECLARE SECTION;

EXEC SQL INSERT INTO Studio(name, address)
    VALUES (:studioName, :studioAddr);
}
</pre>
```

Example in Python:

```
import sqlite3
          connection = sqlite3.connect("company.db")
3
          cursor = connection.cursor()
          staff_data = [ ("William", "Shakespeare", "m", "
     1961-10-25"),
                           ("Frank", "Schiller", "m", "1955-08-17"
     ),
                           ("Jane", "Wall", "f", "1989-03-14") ]
9
          for p in staff_data:
              format_str = """INSERT INTO employee (staff_number,
      fname, lname, gender, birth_date)
              VALUES (NULL, "{first}", "{last}", "{gender}", "{
12
     birthdate}");"""
13
              sql_command = format_str.format(first=p[0], last=p
14
     [1], gender=p[2], birthdate = p[3])
              cursor.execute(sql_command)
```

- Fetch Statement
 - fetch data from the result table one row at a time
 - Syntax:

EXEC SQL FETCH FROM < cursor name > INTO < list of variables >

Example:

```
void worthRanges() {
   int i, digits, counts[15];
   EXEC SQL BEGIN DECLARE SECTION;
   int worth;
   char SQLSTATE[6];
   EXEC SQL END DECLARE SECTION;
   EXEC SQL DECLARE execCursor CURSOR FOR
   SELECT netWorth FROM MovieExec;
```

```
9
               EXEC SQL OPEN execCursor;
               for (i=1; i < 15; i++) counts[i] = 0;</pre>
11
12
               while(1) {
                    EXEC SQL FETCH FROM execCursor INTO :worth; //
13
     fetches a row of value from movieExec and stores in worth
                    if (NO_MORE_TUPLES) break;
14
                    . . .
               }
17
           }
18
19
```

```
