# August 28, 2020

- 1. I need to create a wrapper function my\_malloc that does the following:
  - ask my\_malloc it to allocate n bytes
  - call malloc
  - test malloc doesn't have a null pointer
  - return pointer from malloc

The solution to this problem is:

```
void *my_malloc(int n) {
    void *p;

p = malloc(n);

if (!p) {
    printf("ERROR: Malloc allocation failed");
}

return p;
}
```

#### Notes

- Learned that void function can return value
- Dynamic Storage Allocation
  - Allows to allocate storage during program execution
  - Allows to create data structures and shink and grow array as needed
  - e.g. malloc, calloc, realloc
- Memory Allocation Functions
  - malloc Allocates a block of memory but doesn't initialize it
    - \* doesn't initialize the allocated memory

- \* more efficient than calloc
- \* accessing the content  $\rightarrow$  segmentation fault (accessing value at invalid mem. location) or garbage values
- calloc Allocates a block of memory and clears it
  - \* allocates memory and initializes the memory block to zero
  - \* accessing the content of blocks would return 0
- realloc Resizes a previously allocated block of memory

#### • Null Pointer

- is returned when it fails to allocate a block of memory large enough to satisfy the request

## Example

```
p = malloc(10000);
if (p == NULL) {
  /* allocation failed; take appropriate action */
}
```

2. I need to write a function named duplicate that uses dynamic storage allocation to create a copy of a string.

The requirements of the function are

- duplicate allocates space for a string of the same length as str
- duplicate copies the contents of str into the new string
- duplicate returns a pointer to it
- duplicate returns a null pointer if the memory allocation fails

The solution to this problem is:

```
#include <stdio.h>
#include <stdib.h> // malloc
#include <string.h> // strlen

char *duplicate(const char *str);

int main(void) {
    char s[] = "hello world", *p;

p = duplicate (s);
```

```
11
            printf("Duplicate: %s\n", p);
12
13
            free(p);
14
            return 0;
15
16
17
18
       char *duplicate(const char *str) {
19
20
            char *p, *q;
            const char *r;
21
22
            int n = strlen(str);
23
24
            p = (char *) malloc(n + 1);
25
26
            if (!p) {
27
                return p;
28
            }
29
30
            r = str;
31
            q = p;
32
            while (r < str + n) {</pre>
33
                 *q = *r;
34
                 q++;
35
                 r++;
36
            }
37
38
            *q = ' \setminus 0';
39
40
41
            return p;
42
```

```
Correct Solution:
      #include <stdio.h>
      #include <stdlib.h> // malloc
2
      #include <string.h> // strlen
3
      char *duplicate(const char *str);
6
      int main(void) {
          char s[] = "hello world", *p, *q;
9
          p = duplicate (s);
10
11
          printf("Duplicate: %s\n", p);
12
13
          free(p);
14
          return 0;
15
      }
16
17
```

```
18
19
       char *duplicate(const char *str) {
            char *p, *q;
20
            const char *r;
21
22
            int n = strlen(str);
23
24
            p = (char *) malloc(n + 1);
25
26
            if (!p) {
27
                 p = ((void*)0);
28
                 return p;
29
30
            }
31
            r = str;
32
            q = p;
33
            while (r < str + n) {</pre>
34
                 *q = *r;
35
                 q++;
36
                 r++;
37
            }
38
39
            *q = ' \setminus 0';
40
41
            return p;
42
43
```

### Note

- Null pointer has value ((void\*)0)
- const tag in parameter prevetns the function from modifying what it's pointer variable is pointing to.
  - value is modifiable
  - changes the parameter to pass by value

```
3:    int *create_array(int n, int initial_value) {
      return
    }
}
```

# **Notes**

- Dynamically Allocated Arrays
  - Syntax:

```
int *a;
a = malloc(n * sizeof(int));
```

- returns null pointer if allocation fails
