## CSC373 Worksheet 2 Solution

July 25, 2020

## 1. Notes:

- Greedy Algorithm
  - Always makes the choice that looks best at the moment
    - \* Locally optimal solution leads to globally optimal solution
- Activity-selection Problem (Greedy algorithm using dynamic programming)
  - Goal: Selecting maximum size set of mutually compatible activities

## Example:

- Suppose a set exists  $S = \{a_1 = [s_1, f_1), a_2 = [s_2, f_2), ..., a_n = [s_n, f_n)\}$ 
  - \*  $a_i$  represents an  $i^{th}$  activity
  - \*  $s_i$  represents starting time
  - \*  $f_i$  represents finishing time
  - \*  $0 \le s_i < f_i < \infty$
  - \*  $a_1, ..., a_n$  sorted in monotonically increasing order of finish time

i.e.

$$f_1 \le f_2 \le f_3 \le \dots \le f_{n-1} \le f_n$$

\*  $a_i$  and  $a_j$  are **compatible**, if intervals  $[s_i, f_i)$  and  $[s_j, f_j)$  don't overlap

i.e

$$s_i \ge f_i$$
 and  $s_j \ge f_i$ 

- Steps
  - 1. Think about dynamic programming solution
    - \* Construct optimal solution using two subproblems

 $S_{ij}$ : activities that start after activity  $a_i$  finishes and before activity  $a_j$  starts

i.e.

$$S_{19} = \{a_4 = [5, 7), a_6 = [5, 9), a_7 = [6, 10)\}$$

 $A_{ij}$ : maximum set of mutually compatible activities in  $S_{ij}$  (including  $a_k$ )

- $A_{ik} = A_{ij} \cap S_{ik}$
- $\cdot A_{kj} = A_{ij} \cap S_{kj}$
- $A_{ij} = A_{ik} \cup \{a_k\} \cup Akj$
- · So,  $|A_{ij}| = |A_{ik}| + |A_{kj}| + 1$
- \* Verify that optimal solution  $A_{ij}$  must include optimal solution to the two subproblems for  $S_{kj}$

Let  $A'_{kj}$  be another mutually compatible activities in  $S_{kj}$  where  $|A'_{kj}| > |A_{kj}|$ .

Then we could use  $A'_{kj}$  in a solution to subproblem of  $S_{ij}$ 

Then we have  $|A_{ik}| + |A'_{kj}| + 1 > |A_{jk}| + |A_{kj}| + 1 = |A_{ij}|$  mutually compatible activites

This contradicts assumption that  $A_{ij}$  is an optimal solution

\* Verify that optimal solution  $A_{ij}$  must include optimal solution to the two subproblems for  $S_{ik}$ 

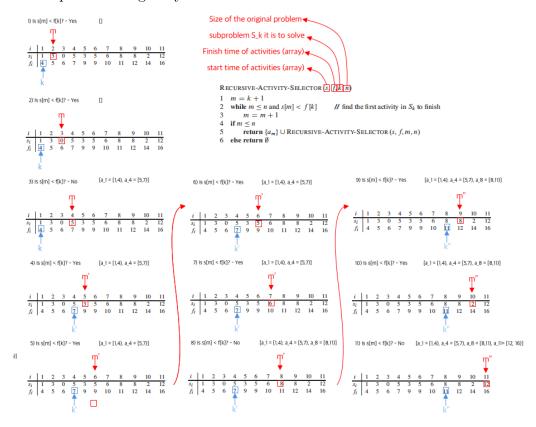

The same applies for activities in  $S_{ik}$ 

- 2. Observe that only one choice greedy choice, and that when we make the greedy choice, only one subproblem remains
  - \* Steps
    - 1. Make a greedy choice
      - · Choose an activity that makes the most resource possible (intuition)
      - · Choose an acitivty that finishes the earliest (intuition)
    - 2. Solve a subproblem: Find activities that start after  $a_1$  finishes
    - 3. Verify that making greedy choices always arrive at optimal solution

## Theorem 16.1 (Page 418):

Consider any non-empty subproble  $S_k$ , and let  $a_m$  be an activity in  $S_k$  with the earliest finish time. Then  $a_m$  is included in some maximum-size subset of mutually compatible activities of  $S_k$ 

3. Develop recursive greedy solution

4. Convert the recursive algorithm into iterative one
