CSC373 Worksheet 0 Solution

July 20, 2020

1. Recurrence: T(n) = T(n-1) + n

Guess: $T(n) = \mathcal{O}(n^2)$.

I need to show $T(n) \leq c \cdot n^2$.

$$T(n) \le c(n-1)^2 + n \tag{1}$$

$$= c(n^2 - 2n + 1) + n (2)$$

$$=cn^2 - c2n + c + n \tag{3}$$

$$\leq cn^2 - c2n + cn + n \tag{4}$$

$$=cn^2 - cn + n \tag{5}$$

$$\leq cn^2 - cn + cn \tag{6}$$

$$=cn^2\tag{7}$$

$\underline{\text{Notes:}}$

- Substitution method
 - Solves recurrences
 - * Recurrence characters the running time of divide-and-conquer algorithm
 - How it works:
 - 1. Make a guess for the solution
 - 2. Use mathematical induction to prove the guess is correct or incorrect.

Example:

Recurrence: $T(n) = 2T(\lfloor n/2 \rfloor) + n$

Guess: $T(n) = \mathcal{O}(n \log n)$,

We need to show $T(n) \le cn \lg n$.

- 1. Assume the bound holds for all positive m < n, in particular $m = \lfloor n/2 \rfloor$
- 2. Find the upper bound of T(m)

$$T(\lfloor n/2 \rfloor) \le c \lfloor n/2 \rfloor \lg(\lfloor n/2 \rfloor)$$

3. Show $T(n) = 2T(\lfloor n/2 \rfloor) + n$ leads to $T(n) \le cn \lg n$

$$T(n) \le 2(c|n/2|\lg(|n/2|)) + n$$
 (8)

$$\leq cn\lg(n/2) + n \tag{9}$$

$$= cn\lg(n) - cn\lg 2 + n \tag{10}$$

$$= cn \lg(n) - cn + n \tag{11}$$

$$\leq cn\lg(n) - cn + cn \tag{12}$$

$$\leq cn \lg(n)$$
(13)

4. Show that the boundary holds using mathematical induction

Doesn't have information in detail. Skipping this for now.

- Making good guess
 - * Three suggestions
 - 1. Using recursion tree
 - 2. Through practice
 - 3. prove loose upper and lower bounds on the recurrence and then reduce the range of uncertainty
- 2. Recurrence: $T(n) = T(\lceil n/2 \rceil) + 1$

Guess:
$$T(n) = \mathcal{O}(\lg n)$$
.

I need to show $T(n) \leq c \cdot \lg n$.

$$T(n) \le c \lg(\lceil n/2 \rceil) + 1 \tag{1}$$

$$\leq c\lg(n/2) + 1

\tag{2}$$

$$=c(\lg n - \lg 2) + 1 \tag{3}$$

$$=c(\lg n-1)+1\tag{4}$$

$$=c\lg n - c + 1\tag{5}$$

$$\leq c \lg n - c + c \tag{6}$$

Correct Solution:

Recurrence: $T(n) = T(\lceil n/2 \rceil) + 1$

Guess: $T(n) = \mathcal{O}(\lg n)$.

I need to show $T(n) \leq c \cdot \lg n$.

$$T(n) \le c \lg(\lceil n/2 \rceil) + 1 \tag{1}$$

$$\leq c\lg(n/2) + 1 \tag{2}$$

$$=c(\lg n - \lg 2) + 1 \tag{3}$$

$$=c(\lg n-1)+1\tag{4}$$

$$=c\lg n - c + 1\tag{5}$$

$$\leq c \lg n - c + c \tag{6}$$

The solution holds for $c \geq 1$.

3. Recurrence: $T(n) = 2T(\lfloor n/2 \rfloor) + n$

Guess (Upperbound): $T(n) = \mathcal{O}(n \lg n)$.

I first need to show $T(n) \leq c \cdot n \lg n$.

$$T(n) = 2T(\lfloor n/2 \rfloor) + n \tag{1}$$

$$= 2c|n/2|\lg|n/2| + n \tag{2}$$

$$\leq 2c \cdot (n/2)\lg(n/2) + n \tag{3}$$

$$= c \cdot n(\lg n - 1) + n \tag{4}$$

$$= cn \lg n - cn + n \tag{5}$$

$$\leq cn \lg n - cn + cn \tag{6}$$

$$\leq cn \lg n$$
(7)

The above inequality holds for $c \geq 1$.

Guess (Lowerbound): $T(n) = \Omega(n \lg n)$.

I first need to show $d \cdot (n-2) \lg(n-2) \le T(n)$.

$$T(n) = 2T(\lfloor (n-2)/2 \rfloor) + n \tag{8}$$

$$\geq 2d|(n-2)/2|\lg|(n-2)/2| + n \tag{9}$$

$$> 2d \cdot ((n-2)/2) \lg((n-2)/2) + n$$
 (10)

$$= d \cdot (n-2)(\lg(n-2)-1) + n \tag{11}$$

$$= d \cdot (n-2) \lg(n-2) - d \cdot (n-2) + n \tag{12}$$

$$\geq d \cdot (n-2)\lg(n-2) - d \cdot (n-2) + (n-2) \tag{13}$$

$$\geq d \cdot (n-2) \lg(n-2) - d \cdot (n-2) + d \cdot (n-2) \tag{14}$$

$$= d \cdot (n-2)\lg(n-2) \tag{15}$$

The above inequality holds for $0 \le d < 1$.

Notes:

• Both upper bound and lower bound don't need to be the same

4.3-3

We saw that the solution of $T(n)=2T(\lfloor n/2 \rfloor)+n$ is $O(n\lg n)$. Show that the solution of this recurrence is also $\Omega(n\lg n)$. Conclude that the solution is $\Theta(n\lg n)$.

First, we guess
$$T(n) \le cn \lg n$$
, upper bound
$$T(n) \le 2c \lfloor n/2 \rfloor \lg \lfloor n/2 \rfloor + n$$

$$\le cn \lg (n/2) + n$$

$$= cn \lg n - cn \lg 2 + n$$

$$= cn \lg n + (1-c)n$$

$$\le cn \lg n$$
,

where the last step holds for $c \geq 1$.

- lower bound

Next, we guess
$$T(n) \geq c(n+2)\lg(n+2)$$
,
$$T(n) \geq 2c(\lfloor n/2 \rfloor + 2)(\lg(\lfloor n/2 \rfloor + 2) + n)$$

$$\geq 2c(n/2 - 1 + 2)(\lg(n/2 - 1 + 2) + n)$$

$$= 2c\frac{n+2}{2}\lg\frac{n+2}{2} + n$$

$$= c(n+2)\lg(n+2) - c(n+2)\lg 2 + n$$

$$= c(n+2)\lg(n+2) + (1-c)n - 2c$$

$$\geq c(n+2)\lg(n+2),$$

where the last step holds for $n \geq \frac{2c}{1-c}$, $0 \leq c < 1$.

4. Recurrence (Merge sort):

$$T(n) = \begin{cases} \Theta(1) & \text{if } n = 1\\ T(\lceil n/2 \rceil) + T(\lfloor n/2 \rfloor) + \Theta(n) & \text{if } n > 1 \end{cases}$$

Guess (upper bound): $T(n) \le c \cdot (n-2) \cdot \lg(n-2)$

$$T(n) \le c(\lceil n/2 \rceil - 2)\lg(\lceil n/2 \rceil - 2) + c(\lfloor n/2 \rfloor - 2)\lg(\lfloor n/2 \rfloor - 2) + dn \tag{1}$$

$$= c(n/2 + 1 - 2)\lg(n/2 + 1 - 2) + c(n/2 + 1 - 2)\lg(n/2 + 1 - 2) + dn$$
 (2)

$$= c((n-2)/2)\lg((n-2)/2) + c((n-2)/2)\lg((n-2)/2) + dn$$
(3)

$$= c(n-2)\lg((n-2)/2) + dn \tag{4}$$

$$= c(n-2)\lg(n-2) - c(n-2) + dn$$
(5)

$$= c(n-2)\lg(n-2) - (d-c)n + 2c \tag{6}$$

$$=c(n-2)\lg(n-2)\tag{7}$$

The bound holds as long as c > d.

Guess (lower bound): $c \cdot (n-2) \cdot \lg(n-2) \le T(n)$

$$T(n) \le c(\lceil n/2 \rceil + 1)\lg(\lceil n/2 \rceil + 1) + c(\lceil n/2 \rceil + 1)\lg(\lceil n/2 \rceil + 1) + dn \tag{8}$$

$$\leq c(n/2 - 1 + 1)\lg(n/2 - 1 + 1) + c(n/2 - 1 + 1)\lg(n/2 - 1 + 1) + dn$$
 (9)

$$= c(n/2)\lg(n/2) + c(n/2)\lg(n/2) + dn$$
(10)

$$= cn\lg(n/2) + dn \tag{11}$$

$$= cn\lg(n) - cn + dn \tag{12}$$

$$= cn \lg(n) + (d-c)n \tag{13}$$

$$\leq c(n-1)\lg(n-1) \tag{14}$$

The bound holds as long as d > c, and $0 \le c < 1$

Notes:

- \bullet the *n* here is asymptotically large
- 5. Recurrence: $T(n) = 2T(\lfloor n/2 \rfloor + 17) + n$

Guess (upper bound): $cn \lg n$

$$T(n) \le 2c(|n/2| + 17)\lg(|n/2| + 17) + n \tag{15}$$

$$\leq 2c((n/2) + 17)\lg((n/2) + 17) + n \tag{16}$$

$$= 2c(n/2)\lg(n/2) + n \tag{17}$$

$$= cn(\lg(n) - 1) + n \tag{18}$$

$$= cn\lg(n) - cn + n \tag{19}$$

$$\leq cn \lg(n) - cn + cn \tag{20}$$

$$= cn \lg(n) \tag{21}$$

6.

$$T(n) = 4T(n/3) + n \tag{1}$$

$$\leq 4c(n/3)^{\log_3 4} + n \tag{2}$$

$$\leq 4c(1/3)^{\log_3 4} n^{\log_3 4} + n \tag{3}$$

$$\leq (4/4)cn^{\log_3 4} + n \tag{4}$$

$$\leq c n^{\log_3 4} + n \tag{5}$$

We cannot advance further since n in $cn^{\log_3 4} + n$ cannot be eliminated.

With the new guess $T(n) \le c n^{\log_3 4} - dn$, we have

$$T(n) = 4T(n/3) + n \tag{6}$$

$$\leq 4c(n/3)^{\log_3 4} - d(n/3) + n \tag{7}$$

$$=4c(n/3)^{\log_3 4} - d(n/3) + n \tag{8}$$

$$= (4/3^{\log_3 4})cn^{\log_3 4} - d(n/3) + n \tag{9}$$

$$= (4/4)cn^{\log_3 4} - d(n/3) + n \tag{10}$$

$$= cn^{\log_3 4} - d(n/3) + n \tag{11}$$

$$\leq c n^{\log_3 4} - d(n/3) + n \tag{12}$$

$$\leq c n^{\log_3 4} \tag{13}$$

The bound holds as long as $d \geq 3$ and $c \geq 1$.

Correct Solution:

Recurrence: $T(n) = 2T(\lfloor n/2 \rfloor + 17) + n$

Guess (upper bound): $cn \lg n$

$$T(n) \le 2c(\lfloor n/2 \rfloor + 17)\lg(\lfloor n/2 \rfloor + 17) + n \tag{14}$$

$$\leq 2c((n/2) + 17)\lg((n/2) + 17) + n \tag{15}$$

$$= 2c(n/2)\lg(n/2) + n \tag{16}$$

$$= cn(\lg(n) - 1) + n \tag{17}$$

$$= cn \lg(n) - cn + n \tag{18}$$

$$\leq cn\lg(n) - cn + cn \tag{19}$$

$$= cn \lg(n) \tag{20}$$

$$T(n) = 4T(n/3) + n \tag{1}$$

$$< 4c(n/3)^{\log_3 4} + n$$
 (2)

$$\leq 4c(1/3)^{\log_3 4} n^{\log_3 4} + n \tag{3}$$

$$\leq (4/4)cn^{\log_3 4} + n \tag{4}$$

$$\leq c n^{\log_3 4} + n \tag{5}$$

We cannot advance further since n in $cn^{\log_3 4} + n$ cannot be eliminated.

With the new guess $T(n) \le c n^{\log_3 4} - dn$, we have

$$T(n) = 4T(n/3) + n \tag{6}$$

$$\leq 4c(n/3)^{\log_3 4} - 4d(n/3)4d(n/3) + n \tag{7}$$

$$=4d(n/3) = 4c(n/3)^{\log_3 4} - 4d(n/3) + n \tag{8}$$

$$=4d(n/3) = (4/3^{\log_3 4})cn^{\log_3 4} - 4d(n/3) + n \tag{9}$$

$$= (4/4)cn^{\log_3 4} - 4d(n/3) + n \tag{10}$$

$$= cn^{\log_3 4} - 4d(n/3) + n \tag{11}$$

$$\leq c n^{\log_3 4} - 4d(n/3) + n \tag{12}$$

$$\leq c n^{\log_3 4} - 4d(n/2) + n \tag{13}$$

$$\leq c n^{\log_3 4} - 2dn + n \tag{14}$$

$$\leq cn^{\log_3 4} - 2dn + dn \tag{15}$$

$$\leq c n^{\log_3 4} - dn \tag{16}$$

7. I need to show $T(n) \le cn^2$

$$T(n) = 4T(n/2) + n \tag{17}$$

$$\leq 4c(n/2)^2 + n\tag{18}$$

$$= (4/4)cn^2 + n (19)$$

$$=cn^2 + n \tag{20}$$

We cannot advance further since n in $cn^2 + n$ cannot be eliminated.

But with the new guess $T(n) \le cn^2 - dn$, we have

$$T(n) = 4T(n/2) + n \tag{21}$$

$$\leq 4c(n/2)^2 - 4d(n/2) + n \tag{22}$$

$$= (4/4)cn^2 - 2dn + n (23)$$

$$\leq cn^2 - 2dn + dn \tag{24}$$

$$=cn^2 - dn (25)$$

The bound holds as long as $d \ge 1$ and $c \ge 1$.

8. Solution:

1. Finding number of levels in recursion tree

$$1 = n/2^i \tag{1}$$

$$2^i = n \tag{2}$$

$$i = \log_2 n \tag{3}$$

2. Finding the total cost of recursion tree

The tree has $n^{\lg 3}$ leaves. So, we have

$$T(n) = n \cdot \sum_{i=0}^{\lg_2(n)-1} (3/2)^i + \Theta(n^{\lg 3})$$
(4)

$$= n \cdot \left(\frac{(3/2)^{\lg_2(n)} - 1}{(3/2) - 1}\right) + \Theta(n^{\lg 3}) \tag{5}$$

$$= 2n \cdot \left((3/2)^{\lg_2(n)} - 1 \right) + \Theta(n^{\lg 3}) \tag{6}$$

$$= 2n \cdot \left(n^{\lg(3/2)} - 1 \right) + \Theta(n^{\lg 3}) \tag{7}$$

$$= 2n \cdot \left(n^{\lg(3/2)} - 1\right) + \Theta(n^{\lg 3}) \tag{8}$$

$$= 2 \cdot \left(n^{\lg 3 - 1 + 1} - n \right) + \Theta(n^{\lg 3}) \tag{9}$$

$$=2\cdot\left(n^{\lg 3}-n\right)+\Theta(n^{\lg 3})\tag{10}$$

$$=2\cdot\left(n^{\lg 3}-n\right)+\Theta(n^{\lg 3})\tag{11}$$

Thus, the guess for the upper bound is $T(n) = \mathcal{O}(n^{\lg 3})$

3. Verifying the correct guess using the subtitution method

Guess:
$$T(n) \le cn^{\lg 3} - dn$$

I need to show the guess holds in the recurrence $T(n) = 3T(\lfloor n/2 \rfloor) + n$.

Indeed we have

$$T(n) = 3T(\lfloor n/2 \rfloor) + n \tag{12}$$

$$\leq 3(c\lfloor n/2\rfloor^{\lg 3}) - d(\lfloor n/2\rfloor) + n \tag{13}$$

$$= 3\left(\frac{cn^{\lg 3}}{3} - d(\frac{n}{2} + 1)\right) + n\tag{14}$$

$$=3\left(\frac{cn^{\lg 3}}{3} - \frac{3dn}{2}\right) + n\tag{15}$$

$$\leq 3\left(\frac{cn^{\lg 3}}{3} - \frac{3dn}{3}\right) + n\tag{16}$$

$$=cn^{\lg 3} - 3dn + n\tag{17}$$

$$\leq cn^{\lg 3} - 3dn + 2dn \tag{18}$$

$$=cn^{\lg 3}-dn\tag{19}$$

And the boundary holds as long as $c \ge 0$ and $d \ge 1$.

Notes:

- Recursion Tree
 - Provides a straightforward way to provide a good guess.
 - Is then verified using subtitution method

Example:

Recurrence: T(n) = 2T(n/2) + 4n, T(1) = 4

1. Finding number of levels in recursion tree

$$1 = n/2^{i}$$

$$2^{i} = n$$

$$(20)$$

$$(21)$$

$$2^i = n (21)$$

$$i = \log_2 n \tag{22}$$

2. Finding the value of guess

$$\sum_{i=0}^{\log_2 n} 4n = 4n \cdot \sum_{i=0}^{\log_2 n} 1 \tag{23}$$

$$=4n(\log_2 n + 1)\tag{24}$$

Example 2:

Recurrence: $T(n) = 3T(n/4) + cn^2$

Steps:

1. Finding number of levels in recursion tree

$$1 = n/4^i \tag{25}$$

$$4^i = n \tag{26}$$

$$i = \log_4 n \tag{27}$$

2. Finding the cost of entire tree

$$T(n) = \sum_{i=0}^{\log_4 n - 1} c(3/16)^i n^2 + \Theta(n^{\log_4 3})$$
(28)

$$= cn^{2} \cdot \sum_{i=0}^{\log_{4} n-1} (3/16)^{i} + \Theta(n^{\log_{4} 3})$$
 (29)

$$< cn^2 \cdot \sum_{i=0}^{\infty} (3/16)^i + \Theta(n^{\log_4 3})$$
 [since *n* is asympt. large] (30)

$$= cn^{2} \left(\frac{1}{1 - (3/16)} \right) + \Theta(n^{\log_{4} 3}) \qquad [Since \sum_{i=0}^{\infty} ar^{i} = \frac{a}{1 - r}] \qquad (31)$$

- Note: $(\log_4(n-1))$ because in $i=0,...i=\log_4(n-1)$ there are $\log_4(n)$ elements
- 3. Finding the upper bound of T(n)

Since the total cost is
$$T(n) = cn^2 \left(\frac{1}{1-(3/16)}\right) + \Theta(n^{\log_4 3})$$
, we have $\mathcal{O}(n^2)$

4. Verify the correctness of guess using subtitution method

$$T(n) \le 3T(|n/4|) + cn^2$$
 (32)

$$\leq 3d\lfloor n/4\rfloor^2 + cn^2 \tag{33}$$

$$\leq 3d(n/4)^2 + cn^2 \tag{34}$$

$$= (3/16)dn^2 + cn^2 (35)$$

$$\leq dn^2$$
 (36)

where the last step holds as long as $d \ge (16/13)c$.

9. Solution:

1. Finding number of levels in recursion tree

$$1 = \frac{n}{2^i} \tag{1}$$

$$2^i = n \tag{2}$$

$$i = \lg n \tag{3}$$

2. Finding the upper bound of T(n)

$$T(n) = n^2 \cdot \sum_{i=0}^{\lg n-1} \frac{1}{2^{2i}} + \Theta(1)$$
 (4)

$$= n^2 \cdot \sum_{i=0}^{\infty} \frac{1}{2^{2i}} + \Theta(1)$$
 [since *n* is asympt. large] (5)

$$= n^2 \cdot \left(\frac{1}{1 - \frac{1}{4}}\right) + \Theta(1) \tag{6}$$

$$=\frac{4n^2}{3} + \Theta(1) \tag{7}$$

Thus, we we can conclude $T(n) = \mathcal{O}(n^2)$

3. Verify the correctness of guess using subtitution method

Guess: $T(n) \le cn^2$

I need to show the guess holds for the recurrence $T(n) = T(\frac{n}{2}) + n$.

And, indeed we have

$$T(n) = T(\frac{n}{2}) + n^2 \tag{8}$$

$$\leq \frac{cn^2}{4} + n^2 \tag{9}$$

$$= \left(\frac{c}{4} + 1\right) \cdot n^2 \tag{10}$$

$$\leq cn^2 \tag{11}$$

$$\leq cn^2 \tag{11}$$

THe boundary holds when $c \ge \frac{4}{3}$.

10. Solution:

Notes:

- The solution has $4^{\lg n} = n^2$. I noticed the same for $3^{\lg n} = n^3$. I had trouble looking for relevant formulas. Is this true in general? I can I replace variables in powers with the base?
- Noticed that in solution, the total cost is found for each term in $T(\frac{n}{2}+2)$ (i.e. first for $\frac{n}{2}$ and second for 2). and then combined together in the end.
