CSC148 Worksheet 6 Solution

Hyungmo Gu

April 19, 2020

Question 1

• The two classes already defined are: Vehicle and SuperDuperManager

The additional classes required to create for this exercise are: Car, Helicopter and MagicCarpet

Car, Helicopter and MagicCarpet are child classes of Vehicle.

Question 2

- a. The following are attributes possessed by all vehicles
 - type
 - initial_position
 - moves_to
 - move_diagonally
 - fuel_usage

Correct Solution:

The following are attributes possessed by all vehicles

- position
- fuel
- b. No. Referencing the following code in worksheet_6_starter_code.py,

we can come up with the following examples.

- Vehicle(100, (10,20))
- Vehicle(50, (5, 10))

Here, we can see the two vehicles have different value of fuel and initial position.

- c. fuel_needed not implemented because each child classes have different fuel consumption rate, and the method is to be defined by the child classes by overriding it.
- d. The following methods must be defined in each of its subclasses
 - Car
 - fuel_needed
 - move
 - Helicopter
 - fuel_needed
 - move
 - MagicCarpet
 - __init__
 - move

Correct Solution:

- Car
 - __init__
 - * Necessary because the parameter position must be set as optional
 - * Necessary because self.position must default to (0,0) if the argument of position not given.
 - fuel_needed
 - * Necessary because vehicle uses fuel

- * Necessary because needs to define the fuel cost based on it not being able to moving diagonally.
- Helicopter
 - __init__
 - * Necessary because the parameter *position* must be set as optional
 - * Necessary because *self.position* must default to (3,5) if the argument of position not given.
 - fuel_needed
 - * Necessary because vehicle uses fuel
 - * Necessary because needs to define the fuel cost based on it being able to move diagonally.
- MagicCarpet
 - __init__
 - * Necessary to set the parameters initial_fuel, initial_position as optional
 - * Necessary to randomize the value of self.position.
 - move
 - * Necessary to set the parameters new_x and new_y as optional.
 - * Necessary to randomize the value of new position.

```
Initializing SuperDuperManager:
      >>> s = SuperDuperManager()
      >>> s._vehicles
      {}
6
      Adding Vehicles:
      >>> s.add_vehicle('Car', '1', 100)
      >>> s._vehicles['1'].__class__.__name__
      >>> s.add_vehicle('Helicopter', '1', 100)
      >>> s._vehicles['1'].__class__.__name__
12
      'Car'
13
14
      >>> s.add_vehicle('Helicopter', '2', 100)
15
      >>> s._vehicles['2'].__class__.__name__
16
      'Helicopter'
17
      >>> s.add_vehicle('UnreliableMagicCarpet','3',100)
19
      >>> s._vehicles['3'].__class__.__name__
20
      'UnreliableMagicCarpet'
21
```

```
22
       Moving Vehicle:
23
       >>> s._vehicles['1'].position
24
       (0,0)
25
       >>> s.move_vehicle('1', 1, 1)
26
       >>> s._vehicles['1'].position
27
       (1,1)
28
29
       >>> s._vehicles['2'].position
30
31
       >>> s.move_vehicle('2', 1, 1)
       >>> s._vehicles['2'].position
33
34
       (4,6)
35
       >>> s._vehicles['3'].position
       (4,8)
37
      >>> s._vehicles['3'].position
38
       (12,4)
39
       >>> s.move_vehicle('3', 1, 1)
40
       >>> s._vehicles['3'].position
41
       (100,100)
42
43
       Get Vehicle Position:
44
       >>> s.get_vehicle_position('1')
45
       (1,1)
46
       >>> s.get_vehicle_position('2')
48
       (4,6)
49
50
       >>> s.get_vehicle_position('3')
       (50,200)
52
53
       Get Vehicle Fuel:
       >>> s.get_vehicle_fuel('1')
       98
56
57
       >>> s.get_vehicle_fuel('2')
58
60
61
       >>> s.get_vehicle_fuel('2')
       100
62
       0.00\,0
63
```

a. The instance attribute id_{-} is used to keep track of vehicles.

The type of the instance attribute is string.

Correct Solution:

The instance attribute *self._vehicles* is used to keep track of vehicles.

The type of the instance attribute is 'dictionary'.

b. The vehicles are initialized in class SuperDuperManager's add_vehicle method.

Correct Solution:

The instance attribute is initialized in class SuperDuperManager's __init_ method.

c. In code that keeps track of all the vehicles, the vehicles are updated via the methods $add_vehicle$ and $move_vehicle$

Question 5

- a. If left as is, every car object would possess the instance attributes *self.position* and *self.fuel* from class Vehicle.
- b. No. Other instance attributes are not necessary.

Looking at the table provided at the beginning of worksheet, car class needs information about initial position, final position, fuel usage, and remaining fuel amount.

For initial and final position, the instance attribute *position* is used.

For fuel usage, this is embedded inside *fuel_needed* method. So, the additional attribute is not necessary.

For fuel remaining, the instance attribute *self.fuel* is used.

Notes:

- 여보, 형모 노래 듣고 있었어요
- https://www.youtube.com/watch?v=5jl8mzCaCr0
- 여보, 형모 내 여보 많이 보고싶어요
- 구래두 여보, 형모 내 여보 보러 꾹 참꾸 걸어요
- 여보, 사랑해
- 여보, 고마워요:)

- a. Car inherits the following methods from class Vehicle: __init__, fuel_needed and move.
- b. Of these inherited methods, fuel_needed needs to be implemented by overriding it.
- c. The two methods needs overriding: __init__ and fuel_needed.

For __init__, because we need to set the parameter initial_position as optional while keeping the rest of the code the same, we want to call the parent method as a helper

For *fuel_needed*, because we need to replace contents within, the parent class method shouldn't be called as a helper.

```
class Car:
def fuel_needed(self, new_x: int, new_y: int) -> int:
# New lines of code here

def fuel_needed(self, new_x: int, new_y: int) -> int:
# New lines of code here
```

Notes:

- 여보!!!!!!!
- 사랑해요 여보
- 형모 당신만을 사랑해

Question 7

Code is also included in worksheet_6_solution.py.

```
super().__init__()
11
12
           def fuel_needed(self, new_x: int, new_y: int) -> int:
13
14
               old_x = self.position[0]
15
               old_y = self.position[1]
16
               delta_x = abs(old_x - new_x)
18
               delta_y = abs(old_y - new_y)
19
20
               return delta_x + delta_y
```

1) Helicopter

• Question 5:

a. If left as is, every helicopter objects would possess instance attributes *self.position* and *self.fuel* from class Vehicle.

This is the same as Car class.

b. No. With the same reasoning as Car class, *self.position* and *self.fuel* are sufficient to do all required operations.

• Question 6:

- a. Just like Car class, Helicopter Class inherits the following methods from class Vehicle: __init__, fuel_needed and move.
- b. Just like Car class, fuel_needed needs to be implemented by overriding it.
- c. With the same reasoning as Car class, the two methods needs overriding: __init__ and fuel_needed.

2) UnreliableMagicCarpet

• Question 5:

- a. If left as is, every UnreliableMagicCarpet object would possess the instance attributes *self.position* and *self.fuel* from class Vehicle.
- b. No. With the same reasoning as Car class, other instance attributes are not necessary.

• Question 6:

- a. UnreliableMagicCarpet inherits the following methods from class Vehicle: __init__, fuel_needed and move.
- b. No inherited methods must be implemented. All methods are implemented by parent class.
- c. The two methods needs overriding: __init__, and move.

For __init__, the following needs modification

- initial_position: This argument needs to be set as optional
- self.position: This instance attribute needs to be set a random integer value

Because we want to change the above while keeping information about *self.fuel*, we want to use parent class method as a helper.

Now, for *move*, we need to replace entire contents within.

Then, it follows from this fact that parent method doesn't need to be called as a helper.

```
class UnreliableMagicCarpet:
def move(self, new_x: int, new_y: int) -> None:
# New lines of code here

4
5
```

```
from worksheet_6_starter_code import Vehicle, SuperDuperManager
      import math
2
3
      0.00
      Question 8.2
5
      class UnreliableMagicCarpet:
          def __init__(self, initial_fuel: int,
10
                           initial_position: Tuple[int, int] = (0,0)) -> None
11
               super().__init__()
12
13
              random.seed(datetime.now())
14
               self.position = (random.randint(-100,100), random.randint
15
     (-100,100))
16
          def move(self, new_x: int, new_y: int) -> None:
17
               self.position = (random.randint(-100,100), random.randint
18
     (-100,100)
```
