# CSC343 Worksheet 12 Solution

# July 1, 2020

# 1. • Keys

- {id of molecule}
- {x position, y position, z position}
- Functional Dependencies
  - 1. id of molecule  $\rightarrow$  x position, y position, z position, x velocity, y velocity, z velocity
  - 2. x position, y position, z position  $\rightarrow$  id of molecule, x velocity, y velocity, z velocity

### Notes:

- Function Dependencies
  - Functional Dependency is a relationship between two attributes typically between the key and other non-key attributes within a table.

#### Example:

 $SIN \rightarrow Name$ , Address, Birthdate

# Example 2:

 $ISBN \rightarrow Title$ 

- Key of Relations
  - One or more attributes  $\{A_1, A_2, ..., A_n\}$  is a key for a relation R if
    - 1. Those attributes functionally determine all other attributes of the relation
    - 2. No proper subset of  $\{A_1, A_2, ... A_n\}$  functionally determines all other attributes of R

## Example:

Given relation

R = Movies1(title, year, length, genre, studioName, starName)

i. {title, year, starName } form a key for the relation Movies1

- ii. { year, starName } is not a key. Same star can be in multiple movies per year
- Superkeys
  - \* Means a set of attributes that contains a key
  - \* Don't need to be minimal

# Example:

Given relation

R = Movies1(title, year, length, genre, studioName, starName)

- · { title, year, starName } is a key and superkey
- · { title, year, starName, title, year, length} is a superkey

# References:

- 1) OpenTextBC, Chapter 11 Functional Dependencies, link
- 2. a) 1.  $AB \rightarrow C$ 
  - 2.  $AB \rightarrow D$
  - 3.  $C \rightarrow A$
  - 4.  $C \rightarrow B$
  - 5.  $D \rightarrow B$
  - 6.  $D \rightarrow C$
  - 7.  $C \rightarrow D$
  - 8.  $D \rightarrow A$

# Second Attempt:

 $\{A,B\}^+=\{A,B,C,D\}$ , so the following non-trivial FDs follows:  $AB\to C$  and  $AB\to D$ .

 $\{C\}^+ = \{D,A\}$ , so the following non-trivial FDs follows  $C \to D$  and  $C \to A$ .

 $\{D\}^+ = \{A\}$ , so the following non-trivial FDs follows:  $D \to A$ .

#### Notes:

- The Splitting / Combining Rule
  - Combining Rule

\* 
$$A_1, A_2, \dots, A_n \to B_i$$
 for  $i = 1, 2, ..., m$  to
$$A_1, A_2, \dots A_n \to B_1, B_2, \dots B_m$$

# Example:

Given

```
title year \rightarrow length
  title year \rightarrow genre
  title year \rightarrow studioName
  it's combined form is
  title year \rightarrow length genre studioName
- Splitting Rule
```

\* 
$$A_1, A_2, \cdots A_n \rightarrow B_1, B_2, \cdots B_m$$
  
to  
 $A_1, A_2, \cdots, A_n \rightarrow B_i \text{ for } i = 1, 2, ..., m$ 

# Example:

Given

title year  $\rightarrow$  length

It's splitted form is

 $title \rightarrow length$  $year \rightarrow length$ 

- Trivial Functional Dependencies
  - A functional dependency  $FD: X \to Y$  is **trivial** if Y is a subset of X

# Exmaple:

title year  $\rightarrow$  title

### Example 2:

 $title \rightarrow title$ 

- Non-trivial Functional Dependencies
  - is a case where some but not all of the attributes on the R.H.S of an FD are also on L.H.S

### Example:

title year  $\rightarrow$  title movieLength

- Can be simplified using **tirivial-dependency rule** 
  - \* The FD  $A_1A_2\cdots A_n\to B_1B_2\cdots B_m$  is equivalent to  $A_1A_2\cdots A_n\to C_1C_2\cdots C_k$

where C's are all those B's that are not in A's.

Figure 3.3: The trivial-dependency rule

- Computing the Clousre of Attributes
  - Closure of attribute set  $\{X\}$  is denoted as  $\{X\}^+$ .
  - The closure means a given set of attributes A satisfying FD, are a sets of all attributes B such that  $A \to B$

### Example:

Given attributes A, B, C, D, E, F and FDs  $AB \to C, BC \to AD, D \to E$  and  $CF \to B$ , What is the closure of  $\{A, B\}$  or  $\{A, B\}^+$ 

- 1. Start with  $\{A, B\}$ .
- 2. Split  $BC \to AD$ 
  - \* We have  $BC \to A$  and BCtoD
  - \* Since A is in  $\{A, B\}$ , this is not included
  - \* Since D is not in  $\{A, B\}$ , this IS included

So, we have  $\{A, B, D\}$ 

- 3. Since C in  $AB \to C$  is NOT in  $\{A, B, C, D\}$ , C is included and we have  $\{A, B, C, D\}$
- 4. Since A in  $BC \to A$  is in  $\{A, B, C, D\}$ , this is skipped
- 5. Since E is not in  $D \to E$ , E is included and we have  $\{A, B, C, D, E\}$  as our solution
- Why the Closure Algorithm Works
- Transitive Rule
  - Definition

If 
$$A_1A_2 \cdots A_n \to B_1B_2 \cdots B_m$$
 and  $B_1B_2 \cdots B_m \to C_1C_2 \cdots C_k$  hold in relation  $R, A_1A_2 \cdots A_n \to C_1C_2 \cdots C_k$  also holds in  $R$ .

# Example:

Given

title year  $\rightarrow$  studioName studioName  $\rightarrow$  studioAddr

Transitive rule says the above is equal to the following

title year  $\rightarrow$  studioAddr

- Inference Rules
  - Is allso called Armstrong's Axioms
  - Has 3 axioms
    - 1. Reflexivity

\* If 
$$\{B_1, B_2, ..., B_n\} \subseteq \{A_1, A_2, ..., A_n\}$$
 then  $A_1 A_2 \cdots A_n \to B_1 B_2 \cdots B_m$ 

- \* also called **trivial FDs**
- 2. Augmentation

\* If 
$$A_1 A_2 \cdots A_n \to B_1 B_2 \cdots B_m$$
  
then  $A_1 A_2 \cdots A_n C_1 C_2 \cdots C_k \to B_1 B_2 \cdots B_m C_1 C_2 \cdots C_k$ 

- \*  $C_1C_2\cdots C_k$  are any set of attributes
- 3. Transitivity

\* If 
$$A_1A_2\cdots A_n \to B_1B_2\cdots B_m$$
 and  $B_1B_2\cdots B_m \to C_1C_2\cdots C_k$   
then  $A_1A-2\cdots A_n \to C_1C_2\cdots C_k$ 

b) A, B is the only key of R.

## Notes:

- Key of Attributes
  - **Definition:** A set of attributes  $\{A_1, A_2, \cdots, A_n\}$  is a key for a relation R if
    - 1. Those attributes functionally determine all other attributes

- 2. No proper subset of  $\{A_1, A_2, ..., A_n\}$  functionally determines all other attributes of R.
- c) The superkeys that are not keys are:  $\{A, B, C\}$ ,  $\{A, B, D\}$ ,  $\{A, B, C, D\}$
- 3. i) a)  $\{A\}^+ = \{A, B, C, D\}$ , so we have  $A \to A$ ,  $A \to B$ ,  $A \to C$ ,  $A \to D$   $\{B\}^+ = \{C, D\}$ , so we have  $B \to C$  and  $B \to D$ 
  - b)  $\{A\}$  is the key of S.
  - c) The super keys that are not keys are:

$$\{A, B\}, \{A, C\}, \{A, D\}, \{A, B, C\}, \{A, B, D\}, \{A, B, C, D\}$$

- ii) a)  $\{A\}^+=\{A,B,C,D\}$ , so we have  $A\to A,\,A\to B,\,A\to C,\,A\to D$   $\{B\}^+=\{C,D\},\,\text{so we have }B\to C\,\,\text{and}\,\,B\to D$ 
  - b)  $\{A\}$  is the key of S.
  - c) The super keys that are not keys are:

$${A,B}, {A,C}, {A,D}, {A,B,C}, {A,B,D}, {A,B,C,D}$$

- iii) a)  $\{A\}^+ = \{A\}$ , so this FD is trivial.
  - $\{B\}^+ = \{B\}$ , so this FD is trivial.
  - $\{C\}^+ = \{C\}$ , so this FD is trivial.
  - ${D}^+ = {D}$ , so this FD is trivial.
  - $\{A,B\}^+ = \{A,B,C,D\}$ , so we have  $AB \to A$ ,  $AB \to B$ ,  $AB \to C$ ,  $AB \to D$
  - $\{A,C\}^+ = \{A,C\}$ , so we have  $AC \to A, AC \to C$
  - $\{A,D\}^+ = \{A,D,B\}$ , so we have  $AD \to A$ ,  $AD \to D$ ,  $AD \to B$
  - $\{B,C\}^+=\{B,C,D,A\},$  so we have  $BC\to A,\,BC\to B,\,BC\to C,\,BC\to D$
  - $\{D,C\}^+ = \{D,C,A,B\}$ , so we have  $DC \to D$ ,  $DC \to C$ ,  $DC \to A$ ,  $DC \to B$
  - $\{A,B,C\}^+=\{A,B,C,D\},$  so we have  $ABC\to A,\;ABC\to B,\;ABC\to C,\;ABC\to D$
  - $\{B,C,D\}^+=\{B,C,D,A\},$  so we have  $BCD\to A,\ BCD\to B,\ BCD\to C,\ BCD\to D$
  - $\{C,D,A\}^+=\{C,D,A,B\},$  so we have  $CDA\to A,\ CDA\to B,\ CDA\to C,\ CDA\to D$

$$\{D,A,B\}^+=\{D,A,B,C\},$$
 so we have  $DAB\to A,\ DAB\to B,\ DAB\to C,\ DAB\to D$ 

$$\{D,A,B\}^+=\{D,A,B,C\},$$
 so we have  $DAB\to A,\ DAB\to B,\ DAB\to C,\ DAB\to D$ 

$${A,B,C,D}^+ = {A,B,C,D}$$
, so this FD is trivial.

- b)  $\{A, B\}, \{A, C\}, \{B, C\}, \{D, C\}$  are the keys of T.
- c)  $\{A,B,C\}$ ,  $\{A,B,D\}$ ,  $\{B,C,D\}$ ,  $\{A,D,C\}$ ,  $\{A,B,C,D\}$  are the superkeys that are not keys of T.
