CSC 369 Midterm 2 Solution

- 1. a) False
 - b) True
 - c)

Notes

• User Mode

- Is restricted
- Executing code has no ability to directly access hardware or reference memory
- Crashes are always recoverable ^[1]
- Is where most of the code on our computer / applications are executed [3]

• Kernel Mode

- Is previleged (non-restricted)
- Executing code has complete and unrestricted access to the underlying hardware
 [3]
- Is generally reserved for the lowest-level, most trusted functions of the operating system [1]
- Is fatal to crash; it will halt the entire PC (i.e the blue screen of death) [3]

• Interrupt

- Are signals sent to the CPU by external devices, normally I/O devices. [2]
- Tells the CPU to stop its current activities and execute the appropriate part of the operating system (**Interrupt Handler**). [2]
- Has three different types ^[2]

1) Hardware Interupts

- * Are generated by hardware devices to signal that they need some attention from the OS.
- * May be due to receiving some data

Examples

- · Keystrokes on the keyboard
- · Receiving data on the ethernet card
- * May be due to completing a task which the operating system previous requested

Examples

Transfering data between the hard drive and memory

CSC 369 Midterm 2 Solution

2) Software Interupts

* Are generated by programs when a system call is requested

3) Traps

- * Are generated by the CPU itself
- * Indicate that some error or condition occured for which assistance from the operating system is needed

• Content Switch

- Is switching from running a user level process to the OS kernel and often to other user processes before the current process is resumed
- Happens during a timer interrupt or system call
- Saves the following states for a process during a context switch
 - * Stack Pointer
 - * Program Counter
 - * User Registers
 - * Kernel State
- May hinder performance

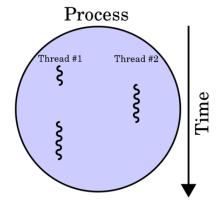

• System Call

Example

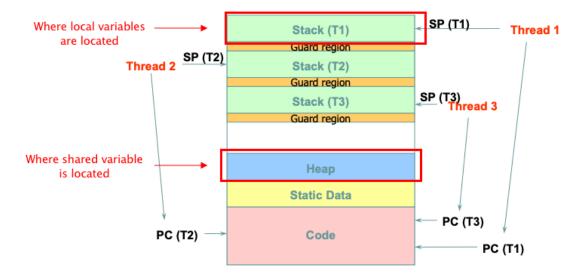

- yield()
 - * Is a system call
 - * Causes the calling thread to relinquish the CPU
 - * Places the current thread at the end of the run queue
 - * Schedules another thread to run

• Thread

- Is a lightweight process that can be managed independently by a schdeduler [4]
- Improves the application performance using parallelism. (e.g peach)

CSC 369 Midterm 2 Solution

- A thread is bound to a single process
- A process can have multiple threads
- Has two types
 - * User-level Threads:
 - * Kernel-level Threads:

•
