CSC373 Worksheet 7 Solution

August 14, 2020

1. My Work

The longest simple cycle problem is the problem of finding a cycle of maximum length in a graph ^[5].

The decision problem is, given k, to determine whether or not the instance graph has a simple cycle of length at least k. If yes, output 1. Otherwise, output 0.

My Work

The language corresponding to the decision problem is as follows:

LONGEST-SIMPLE-CYCLE = $\{\langle G, v_0, v_1, ..., v_k, k \rangle : G = (V, E) \text{ is an undirected graph}$ $k \geq 3 \text{ is an integer},$ $v_0, v_1, ..., v_k \in V \text{ are distinct},$ $v_0 = v_k,$ There should exist a simple cycle in G with at least k edges $\}$

<u>Notes</u>

- A Cycle in an Undirected Graph
 - A path $\langle v_0, v_1, ..., v_k \text{ forms a cycle if } k \geq 3, \text{ and } v_0 = v_k.$
- Simple Cycle
 - A cycle is simple if $v_1, v_2, ..., v_k$ are distinct
- Decision Problem

- Is the problem with yes/no solution

• Alphabet

- Is a finite set of symbols
- Is denoted Σ

Example:

For decision problem, its alphabet is: $\Sigma = \{0, 1\}$

- * 1 means 'yes'
- * 0 means 'no'

• Language

- Is any set of strings made of symbols from Σ
- Is denoted L

Example:

$$L = \{10, 11, 101, 111, 1011, 1101, 10001\}$$

- Is denoted Σ^* for language of all strings over Σ plus empty string ϵ .

Example:

$$\Sigma^* = \{\epsilon, 0, 1, 00, 01, 11, 000, \ldots\}$$

Example 2:

The decision problem PATH has the corresponding language

PATH =
$$\{\langle G, U, v, k \rangle : G = (V, E) \text{ is an undirected graph,}$$

 $u, v \in V,$
 $k \geq 0 \text{ is an integer, and}$
tere exists a path from u to v in G
consisting of at most k edges $\}$

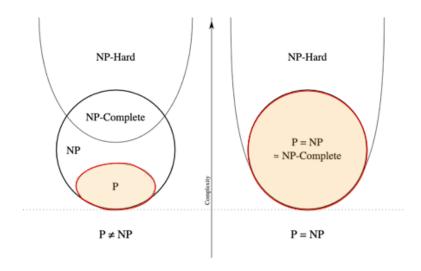

• P

– Is set of problems that can be solved by a deterministic Turing machine in Polynomial time (i.e. $\mathcal{O}(n^k)$) ^[2].

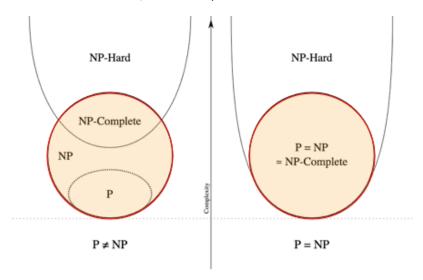

Example:

1) Shortest path problems

- 2) Calculating the greatest common divisor
- 3) Finding maximum bipartite matching

• NP (Non-deterministic Polynominal):

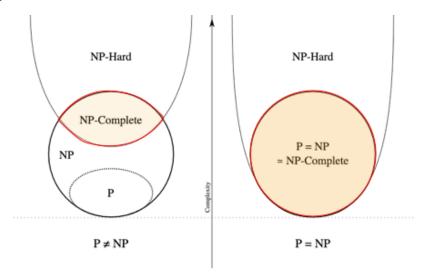

- Is set of decision problems that can be solved by a Non-deterministic Turing Machine in Polynomial time. $^{[2]}$
- Has no particular rule is followed to make a guess $^{\left[1\right]}.$
- Can be solved in polynominal time via a "lucky algorithm", a magical algorithm that always make a right guess $^{[2]}$
- $-P \subseteq NP$

Examples:

- Longest-path problems
- Hamiltonian Cycle

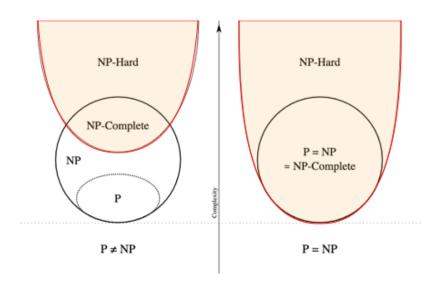

- Graph coloring

• NP-Complete Problems:

- A decision problem A is NP-complete (NPC) if
 - 1) $A \in NP$ and
 - 2) Every (other) problems A' in NP is reducible to A
- Has no efficient solution in polynominal number of steps (not yet) [3]
- Is not likely that there is an algorithm to make it efficient [3]

• NP-Hard:

- A decision problem A is NP-hard if
 - 1) $A \in NP$ (Not necessarily) and
 - 2) Every (other) problems A' in NP is reducible to A
- NP-Hard means "at least as hard as any problems in NP"

- Does not have to be about decision problems

Example:

1) Alan Turing's Halting Problem
