CSC373 Worksheet 3 Solution

July 29, 2020

1. Using the following formula

$$M[i, j] = \begin{cases} 0 & \text{if } i = j \\ \min_{i \leq k \leq j} M[i, k] + M[k + 1, j] + p_{i-1}p_k p_j & \text{if } i < j \end{cases} \tag{1}$$

we have

C	1	2	3	4	5	6
1	0	350	770	612	1212	1422
2	x	0	840	462	1662	1362
3	x	x	0	252	1092	1098
4	x	x	x	0	1440	936
5	x	x	x	x	0	720
6	x	x	x	x	x	0

And an optimal parenthesization is

My Work:

$(A_1 A_2)(A_3 A_4)(A_5 A_6)$

Notes:

- Sequence of Dimensions

  The sequence of dimensions $< p_0 = 5, p_1 = 10, p_2 = 3, p_2 = 12, p_3 = 5, p_4 = 50, p_5 = 6 >$ means there are 6 matrices with dimensions $p_{i-1} \times p_i$

  - $A_1 \to 5 \times 10$

- $A_2 \rightarrow 10 \times 3$
- $A_3 \rightarrow 3 \times 12$
- $A_4 \rightarrow 12 \times 5$
- $A_5 \rightarrow 5 \times 50$
- $A_6 \rightarrow 50 \times 6$

- Dynamic Programming
  - Is applied to optimization problems
  - Applies when the subproblems overlap
  - Uses the following sequence of steps
    1. Characterize the structure of an optimal solution
    2. Recursively define the value of an optimal solution
    3. Construct an optimal solution from computed information

- Matrix-chain Multiplication
  - Is an optimization problem solved using dynamic programming
  - Goal is to find matrix parenthesis with fewest number of operations

  Example:

  Given chain of matrices $< A, B, C >$, it's fully parenthesized product is:

  - $(AB)C$ needs $(10 \times 30 \times 5) + (10 \times 5 \times 60) = 1500 + 3000 = 4500$ operations
  - $A(BC)$ needs $(30 \times 5 \times 60) + (10 \times 30 \times 60) = 27000$ operations

  Thus, $(AB)C$ performs more efficiently than $A(BC)$.

  - Is stated as: given a chain $< A_1, A_2, ..., A_n >$ of n matrices, where for $i = 1, 2, ..., n$ matrix A_i has dimension $p_{i-1} \times p_i$, fully parenthesize the product $A_1 A_2 ... A_n$ in a way that minimizes the number of scalar multiplications.
  - Steps
    1. **Check is the problem has Optimal Substructure**

    Let us adopt the notation $A_{i...j}$ where $i \leq j$, for the matrix that results from evaluating the product $A_i A_{i+1} ... A_j$.

    Assume the solution has the following parentheses:

    $$(A_{i...k})(A_{k+1...j})$$

    If there is a better way to multiply $(A_{i...k})$, then we would have a more optimal solution.

This would be a contradiction, as we already stated that we have the optimal solution for $A_{i...j}$.

Therefore, this problem has optimal substructure.

2. **Find the Recursive Solution**

Let $M[i, j]$ be the cost of multiplying matrices from A_i to A_j

We want to find out at which $'k'$ returns the fewest number of multiplications, or the minimum number of M.

The recursive formula for the cost of multiplying from A_i to A_j is

$$M[i, j] = \begin{cases} 0 & \text{if } i = j \\ \min_{i \leq k \leq j} M[i, k] + M[k+1, j] + p_{i-1} p_k p_j & \text{if } i < j \end{cases} \qquad (2)$$

3. **Computing the Estimated Cost**
   * Steps
     1) Fill the table for $i = j$
     2) Fill the table for $i < j$ with a spread of 1
     3) Repeat 2 with the increased value of spread

   Example:

   Given
   $< A_1, A_2, A_3, A_4, A_5 >$

   where
   * $A_1 \rightarrow 4 \times 10$
   * $A_2 \rightarrow 10 \times 3$
   * $A_3 \rightarrow 3 \times 12$
   * $A_4 \rightarrow 12 \times 20$
   * $A_5 \rightarrow 20 \times 7$

   we have:

   1) Fill the table for $i = j$

1) i = j

i \ j	1	2	3	4	5
1	0				
2	x	0			
3	x	x	0		
4	x	x	x	0	
5	x	x	x	x	0

$$M[i,j] = \begin{cases} 0 & \text{if } i = j \\ \min_{i \le k \le j} M[i,k] + M[k+1,j] + p_{i-1}p_kp_j & \text{if } i < j \end{cases}$$

2) Fill the table for $i < j$ with a spread of 1

2) (i = 1, j = 2), (i = 2, j = 3), (i = 3, j = 4), (i = 4, j = 5)

i \ j	1	2	3	4	5
1	0	120			
2	x	0	360		
3	x	x	0	720	
4	x	x	x	0	1680
5	x	x	x	x	0

since

∗ $i = 1, j = 2$

$$M[1,2] = \min_{1 \le k \le 2}(M[1,1] + M[1,2] + p_{i-1}p_kp_j) \tag{3}$$

$$= \min_{1 \le k \le 2}(0 + 0 + p_0 p_1 p_2) \tag{4}$$

$$= \min_{1 \le k \le 2}(0 + 0 + 4 \cdot 10 \cdot 3) \tag{5}$$

$$= 120 \tag{6}$$

where $p_0 = 3$ is from the dimension 3×10 of A_1, $p_k = 10$ is from the dimension of 3×10 of A_1.

∗ $i = 2, j = 3$

$$M[2,3] = \min_{2 \leq k \leq 3} (M[2,2] + M[3,3] + p_{i-1}p_kp_j) \tag{7}$$

$$= \min_{2 \leq k \leq 3} (0 + 0 + p_1p_2p_3) \tag{8}$$

$$= \min_{2 \leq k \leq 3} (0 + 0 + 10 \cdot 3 \cdot 12) \tag{9}$$

$$= 360 \tag{10}$$

         * $i = 3, j = 4$

$$M[3,4] = \min_{3 \leq k \leq 4} (M[3,3] + M[4,4] + p_{i-1}p_kp_j) \tag{11}$$

$$= \min_{3 \leq k \leq 4} (0 + 0 + p_2p_3p_4) \tag{12}$$

$$= \min_{3 \leq k \leq 4} (0 + 0 + 3 \cdot 12 \cdot 20) \tag{13}$$

$$= 720 \tag{14}$$

         * $i = 4, j = 5$

$$M[4,5] = \min_{4 \leq k \leq 5} (M[4,4] + M[5,5] + p_{i-1}p_kp_j) \tag{15}$$

$$= \min_{4 \leq k \leq 5} (0 + 0 + p_3p_4p_5) \tag{16}$$

$$= \min_{4 \leq k \leq 5} (0 + 0 + 12 \cdot 20 \cdot 7) \tag{17}$$

$$= 1680 \tag{18}$$

3) Repeat 2 with the increased value of spread

    2) (i = 1, j = 2), (i = 2, j = 3), (i = 3, j = 4), (i = 4, j = 5)

i \ j	1	2	3	4	5
1	0	120	264	1080	1344
2	x	0	360	1320	1350
3	x	x	0	720	1140
4	x	x	x	0	1680
5	x	x	x	x	0

         * $i = 1, j = 3$

       $\underline{k = 1}$

$$M[1,3] = M[1,1] + M[2,3] + p_{i-1}p_kp_j \tag{19}$$
$$= 0 + 360 + p_0p_1p_3 \tag{20}$$
$$= 0 + 360 + 4 \cdot 10 \cdot 12 \tag{21}$$
$$= 0 + 360 + 480 \tag{22}$$
$$= 840 \tag{23}$$

$\underline{k = 2}$

$$M[1,3] = M[1,2] + M[3,3] + p_{i-1}p_kp_j \tag{24}$$
$$= 120 + 0 + p_0p_2p_3 \tag{25}$$
$$= 120 + 0 + 4 \cdot 10 \cdot 12 \tag{26}$$
$$= 120 + 0 + 144 \tag{27}$$
$$= 264 \tag{28}$$

Thus, $\min_{1 \le k \le 3} M[1,3] = 264$.

∗ $i = 2, j = 4$

$\underline{k = 2}$

$$M[2,4] = M[2,2] + M[3,4] + p_{i-1}p_kp_j \tag{29}$$
$$= 0 + 720 + p_1p_2p_4 \tag{30}$$
$$= 0 + 720 + 10 \cdot 3 \cdot 20 \tag{31}$$
$$= 0 + 720 + 600 \tag{32}$$
$$= 1320 \tag{33}$$

$\underline{k = 3}$

$$M[2,4] = M[2,2] + M[3,4] + p_{i-1}p_kp_j \tag{34}$$
$$= 360 + 0 + p_1p_3p_4 \tag{35}$$
$$= 360 + 0 + 10 \cdot 12 \cdot 20 \tag{36}$$
$$= 360 + 0 + 2400 \tag{37}$$
$$= 2760 \tag{38}$$

Thus, $\min_{2 \le k \le 4} M[2,4] = 1320$.

* $i = 3, j = 5$

<u>$k = 3$</u>

$$\begin{align}
M[3,5] &= M[3,3] + M[3,5] + p_{i-1}p_k p_j \tag{39}\\
&= 0 + 1680 + p_2 p_3 p_5 \tag{40}\\
&= 0 + 1680 + 3 \cdot 12 \cdot 7 \tag{41}\\
&= 0 + 1680 + 252 \tag{42}\\
&= 1932 \tag{43}
\end{align}$$

<u>$k = 4$</u>

$$\begin{align}
M[3,5] &= M[3,4] + M[5,5] + p_{i-1}p_k p_j \tag{44}\\
&= 720 + 0 + p_2 p_4 p_5 \tag{45}\\
&= 720 + 0 + 3 \cdot 20 \cdot 7 \tag{46}\\
&= 720 + 420 \tag{47}\\
&= 1140 \tag{48}
\end{align}$$

Thus, $\min_{3 \le k \le 5} M[3,5] = 1140$.

* $i = 2, j = 5$

<u>$k = 2$</u>

$$\begin{align}
M[2,5] &= M[2,2] + M[3,5] + p_{i-1}p_k p_j \tag{49}\\
&= 0 + 1140 + p_1 p_2 p_5 \tag{50}\\
&= 0 + 1140 + 10 \cdot 3 \cdot 7 \tag{51}\\
&= 0 + 1140 + 210 \tag{52}\\
&= 1350 \tag{53}
\end{align}$$

<u>$k = 3$</u>

$$\begin{align}
M[2,5] &= M[2,3] + M[4,5] + p_{i-1}p_k p_j \tag{54}\\
&= 360 + 1680 + p_1 p_3 p_5 \tag{55}\\
&= 2040 + 10 \cdot 12 \cdot 7 \tag{56}\\
&= 2040 + 840 \tag{57}\\
&= 2880 \tag{58}
\end{align}$$

$\underline{k = 4}$

$$M[2,5] = M[2,4] + M[5,5] + p_{i-1}p_kp_j \tag{59}$$
$$= 1320 + p_1p_3p_5 \tag{60}$$
$$= 1320 + 10 \cdot 20 \cdot 7 \tag{61}$$
$$= 1320 + 1400 \tag{62}$$
$$= 2720 \tag{63}$$

Thus, $\min_{2 \le k \le 5} M[2,5] = 1350$.

* $i = 1, j = 5$

$\underline{k = 1}$

$$M[1,5] = M[1,1] + M[3,5] + p_{i-1}p_kp_j \tag{64}$$
$$= 0 + 1350 + p_0p_1p_5 \tag{65}$$
$$= 0 + 1350 + 4 \cdot 10 \cdot 7 \tag{66}$$
$$= 0 + 1350 + 280 \tag{67}$$
$$= 1630 \tag{68}$$

$\underline{k = 2}$

$$M[1,5] = M[1,2] + M[3,5] + p_{i-1}p_kp_j \tag{69}$$
$$= 120 + 1140 + p_0p_2p_5 \tag{70}$$
$$= 120 + 1140 + 4 \cdot 3 \cdot 7 \tag{71}$$
$$= 1260 + 84 \tag{72}$$
$$= 1344 \tag{73}$$

$\underline{k = 3}$

$$M[1,5] = M[1,3] + M[4,5] + p_{i-1}p_kp_j \tag{74}$$
$$= 264 + 1680 + p_0p_3p_5 \tag{75}$$
$$= 264 + 1680 + 4 \cdot 12 \cdot 7 \tag{76}$$
$$= 1944 + 336 \tag{77}$$
$$= 2280 \tag{78}$$

$\underline{k = 4}$

$$M[1,5] = M[1,4] + M[5,5] + p_{i-1}p_kp_j \tag{79}$$
$$= 1080 + 0 + p_0p_4p_5 \tag{80}$$
$$= 1080 + 4 \cdot 20 \cdot 7 \tag{81}$$
$$= 1080 + 560 \tag{82}$$
$$= 1640 \tag{83}$$

Thus, $\min_{1 \leq k \leq 5} M[1,5] = 1344$.

4. **Constructing the Optimal Solution**

3)

i \ j	1	2	3	4	5
1	0	120	264	1080	1344
2	x	0	360	1320	1350
3	x	x	0	720	1140
4	x	x	x	0	1680
5	x	x	x	x	0

$$(A_1 A_2)((A_3 A_4)A_5)$$

So, the optimal solution is $(A_1 A_2)((A_3 A_4)A_5)$

References:

1)

2. **Example:**

- *MATRIX-CHAIN-ORDER* computes the table s containing optimal costs
- s table consists of k value at which $m[i,j]$ is minimum!!
